## SNMP upgrade draws praise but little action

Net management vendors slow to support protocol in wares

By Lynda Radosevich and Elisabeth Horwitz

Enhancements to the SNMP standard could help users ease scalability, performance and security problems inherent in current SNMP network management systems. However, while key industry players voice support for the enhanced protocol, most are only slowly committing to specifics in their network management products.

Simple Network Management Protocol is a network monitoring and control protocol used by virtually all major network management products as well as hub and router vendors.

SNMP Version 2 can speed up performance by sending information from managed devices, such as hubs and routers, in bulk rather than in small pieces, as current SNMP systems do. It also solves security problems by adding authentication and encryption to passwords.

"We're looking for that added security as we start looking up to the Internet," said Kim Shirane, a systems programmer at Rocky Mountain Health Care in Denver. For instance, SNMP 2 security could help keep unauthorized Internet users from accessing network management systems and shutting down a hub, which is a possibility now, he said.

Furthermore, SNMP 2 allows for distributed SNMP, page 8

AT&T/Lotus server deal could greatly expand groupware applications

By Lynda Radosevich

The reported negotiations between Lotus Development Corp. and AT&T for a national Notes public server network could be a boon for corporations looking to conduct business-to-business electronic discussions. Industry observers said. The pending deal should help businesses extend their own Notes-based electronic services to small businesses and individuals.

Industry sources said last week that Lotus and AT&T are discussing a deal to provide Notes on a na-

tional network and to offer a special "Notes line" client that removes the complex programming features from the current version of Notes. The service could be available in June, according to sources close to the deal.

**For non-Notes users**  
The client software would allow Notes sites to distribute a low-cost, customized, read/write-only version of the Notes client for use by non-Notes sites.

Moreover, the public server would save companies the pain of setting up their own point-to-point

connections for private intercompany discussions, allowing them to broadcast information as is possible on various on-line services.

While exact terms of the Lotus/AT&T arrangement are still being negotiated, Furman Selig, Inc., a research firm in New York, published a report last week stating that Lotus will receive 10% of all revenue generated from the AT&T service.

Lotus and AT&T would not comment on the negotiations.

Several industry observers questioned the royalty figure, saying it seemed unlikely. "I am not

## Host users passing on license reforms

By Thomas Hoffmann

User outrage over the rigidity and high costs of host systems software has driven many vendors to abandon traditional tiered-based schemes. But it appears that only a few users have taken the bait.

Users at shops that have not abandoned the tiered pricing model claim they are wary of locking into expensive, long-term licensing pacts for mainframe software that may be nearly obsolete. However, those who have

adopted the new licensing schemes say they have fewer administrative hassles, improved budget predictability, more flexible software use and occasional cost savings.

Some information systems executives say they have not seen the cost justification to move to the new pricing schemes. Still other users said they are keeping a keen eye on IBM's plans to introduce usage-based licensing, the status of which remains muddled.

"We don't see how Licensing, page 11

### Reinventing government

## Procurement horror stories draw Feds' scrutiny

By Gary H. Anthes  
WASHINGTON

Procurement expert Bob Dornan told the story of a U.S. Navy official who called him recently in a PC crisis.

Apparently the official's unit had for years purchased PCs from Gateway 2000, Inc., and the Navy had found the machines capable, cost-effective and easy to buy.

"But then a procurement official—in his infinite wisdom—decided to opt out for bids," explained Dornan, senior vice president at Federal Sources, Inc. in McLean, Va., a consultancy specializing in federal information systems procurement. "They ended up with ratty PCs. There were 10 of them stacked up in the [official's] office; she couldn't even take them out of the

GSA administrator Roger W. Johnson: "We haven't been deluged; we've been obdurate."

boxes because they didn't have the Underwriters Laboratory certification. But they were cheaper."

Everyone has a favorite horror story about how the government messes up when Procurement, page 19

## INSIDE: HiRE EDUCATION

Buyer beware: Executive education programs can cost up to \$25,000, but what do IS managers really get for their time and money? Some learn how to lead; others get little more than names for their Rolodex.

## Unix platforms

# Notes for Solaris may spur consolidations

By Michael Vizard

■ Lotus Development Corp. is expected to deliver this week its first Unix implementation of Notes, nearly 12 months after announcing the project.

Initially, Notes will be available on Solaris 1.1 systems from Sun Microsystems, Inc. Other Unix platforms that will be supported this year include SCO Unix from The Santa Cruz Operation, Sun's Solaris 2.0, Hewlett-Packard Co.'s HP/UX and IBM's AIX. Microsoft Corp.'s Windows NT support is also due this year.

Previously, Lotus executives had said Unix implementations would follow about a Lotus month after Solaris 1.1 shipped, but a Lotus spokeswoman last week would commit only to deliveries sometime this year.

## NLM on the way

Meanwhile, the availability of a NetWare Loadable Module (NLM) version of Notes for Novell, Inc. networks has slipped slightly from February to March, company officials said.

The availability of Notes on the new platforms is expected to speed up the changing of clients, particularly for users with large Notes installations who will be able to consolidate Notes databases running on OS/2 servers onto

larger Unix and NLM platforms.

"We've got a number of clients that want to have 100 to 150 people access the same server. What they are looking at is supporting a large number of users with fewer servers," said Norman Weizer, a consultant at Electronic Data Systems Corp. in Lexington, Mass.

Notes on RISC platforms running Solaris is about three times faster than it is on OS/2 and supports as many as 150 users per server, said Leon Alexandrou, a systems engineer at Synetics Corp., a Notes consulting firm in Wakefield, Mass. That is about twice as many users recommended for the OS/2 implementation of Notes, he said.

Many users said they are driven toward Unix and the NLM because they do not wish to support multiple operating systems at their sites.

"The past year, we saw a lot of pilots; this year we'll see a lot of rollouts using the more robust back-end servers," Alexandrou said.

In addition, some Notes customers may opt to use Notes running on Unix systems to provide a hub for linking remote Notes sites over the Internet.

"Most corporations are going to use private networks. They don't want to put corporate information out over the Internet for security reasons," Weizer said.

## Much ado about Notes

**A**s part of its continuing bid to build an industry around Notes, Lotus last week announced that 10 software vendors have signed on to support Notes/FX, a protocol that allows applications to replace the existing Notes editor.

Notes/FX consists of Version 1.0 of the Object Linking and Embedding interface in Windows and the Notes application programming interface (API) to allow PC applications, such as the ones in SmartSuite, to use Notes as a container for stored documents.

Last week at Networks Expo in Boston, Absolutix, Inc., Brainstorm Technologies, Inc., Clear Software, Inc., Distributed Sys-

tems Solutions International, MFJ International, No Hands Software, Inc., Oxyg, Inc. and Revelation Technologies, Inc. all announced the inclusion of Notes/FX in their software.

## For custom service

In addition, Corporate Image Software, Inc. in Cambridge, Mass., announced a service that will help corporate information systems shops integrate Notes/FX with their custom applications.

Meanwhile, Microsoft, WordPerfect Corp. and Borland International, Inc. have already licensed the Notes API, but some have announced specific product delivery plans.

—Michael Vizard

# OpenDoc group plans anti-OLE campaign

By Michael Vizard

As part of an overall bid to drum up support from software providers, the leading backers of the OpenDoc specification last week committed to a full delivery date for the compound document architecture for Windows, Macintosh and OS/2 platforms.

But OpenDoc's success will depend on whether backers can convince developers that OpenDoc's technical advantages warrant diverting their limited resources away from Microsoft Corp.'s Object Linking and Embedding (OLE) 2.0.

## Amassing the troops

Led by IBM, Apple Computer, Inc. and WordPerfect Corp., the backers of OpenDoc have created the Component Integration Laboratories (CIL) in San Francisco to establish their architecture as a counter to the OLE specification for Windows and the Macintosh (CW, Sept. 30, 1990).

Both architectures are the strategic object technologies that vendors will use to seamlessly integrate PC applications with one another.

Apple plans to make OpenDoc available on the Macintosh by this fall, and IBM will incorporate it in OS/2. WordPerfect will make it available for Windows in the same time frame. In addition, WordPerfect will provide the technology to let OpenDoc applications share data with OLE applications.

Meanwhile, other members of CIL, which in-

## Object in question

\*Expected in Cairo object-oriented operating system next year

## OLE support

Next month, Microsoft will deliver OLE 2.0 support in its

Powerpoint presentation graphics package, bringing that application up to par with Word and Excel in OLE 2.0 support. OLE 2.0 support for Access is due this spring and for Mail, later this year.

clude Novell, Inc., Oracle Corp., SunSoft, Inc., Tulieng, Inc. and Xerox Corp., are working to bring OpenDoc to Unix platforms.

## How they differ

OpenDoc differs from OLE in that it includes a distributed computing infrastructure that allows applications to share data across a network.

OpenDoc supports the multiple inheritance of functions across multiple objects and allows users to create objects that span multiple pages. According to CIL members, OpenDoc also supports the Common Object Request Broker Architecture standard created by the Object Management Group.

Other key issues, they said, include the fact that OpenDoc is easier to work with. Creating a typical OpenDoc application requires developers to provide one interface and 50 functions. That same application in OLE 2.0 would require 13 interfaces and 128 functions.

Microsoft counters that OLE 2.0 was designed for a much richer set of long-term goals because it is the basis for Microsoft's future object-oriented operating system, Cairo. As such, OLE 2.0 is necessarily more complex than an OpenDoc specification aimed only at creating compound documents.

Integrating Windows and OS/2 is a key challenge for integrating adopters. See story page 39.

## Corrections

A story in the Feb. 7 issue incorrectly stated that Microsoft Corp. has shipped 30 million copies of Windows. The correct figure is more than 40 million copies.

Due to a reporting error in the Jan. 31 issue, the National Micro Manufacturers Association was inaccurately referred to as a regional group.

Total revenue figures for information technology training and education cited in "Training changes" (CW, Jan. 24) should have indicated growth from \$5.86 billion last year to \$9.97 billion by 1997, according to International Data Corp.

The 1993 revenue figures for the Jan. 31 Industry Pulse for Intel Corp., NEC America, Inc., Motorola, Inc., Toshiba Corp. and Hitachi America, Ltd. were listed in billions, not millions.

Due to a reporting error in the Dec. 27/Jan. 3 issue, the story "Digital assistants to come of age in 1994" stated that United Missouri Bank had purchased 30 Apple Computer Inc. Newton 1144s.

The map that accompanied the Jan. 31 story "Intel evangelizes 'telePCs' to masses" should have shown that Oklahoma, Kansas, Missouri and Arkansas are part of Southwest Bell, not US West.

Due to a reporting error, the name of Milwaukee-based software consulting firm McHugh Freeman and Associates was misspelled in a story in the Jan. 24 issue.

## Microkernel tie to client/server

**W**hat operating system makes for the most effective client/server implementations? Advocates of the microkernel approach say systems that embrace the minimalist design will lead to better client/server systems. IBM's upcoming Office OS, based on the Mach microkernel system, and the more layered approach of Microsoft's Windows NT provide contrasting ways of looking at this issue.

In effect, we already know that established operating systems provide a rocky path. IBM's MVS, Digital's VMS and most of today's Unix versions make good server systems but have the drawback of being too bulky to also sit on a client system. They are also monolithic in that they consist of a series of interlocking software layers that force an active process to proceed up and down them through a series of prescribed steps, like traversing a ladder.

Windows NT is different from the monolithic model in some respects and resembles it in others. IBM's Office OS comes closer to a true microkernel model, or at least that is the claim of Larry Loucks, IBM fellow and spokesman for Personal Systems Software architecture, at a recent gathering in Austin, Texas.

In its core executive, NT represents a breaking up of the rigid layers into discrete modules that can interact with one another rather than going through a prescribed hierarchy. In this way, Windows NT resembles the microkernel approach. The executive's components—process manager, I/O manager, virtual memory manager and others—are interfaced directly into a kernel that grants them access to the hardware.

But other services, including I/O and networking, also perform their work inside the executive, bolting it up and giving it more layered characteristics. Helen Carrier, author of *Inside Windows NT* from Microsoft Press, wrote that those services make the NT executive "a complete operating system unto itself." The structure of Windows NT borrows from both the layered model and the client-server [microkernel] model.

"This approach was taken because Microsoft's design team wished to give NT as much built-in networking performance as possible, probably with an eye toward competing with Novell's NetWare. It is quicker for procedure calls to execute in the shared memory of kernel space than it is to send and receive messages between discrete modules outside the kernel."

A true microkernel approach, however, is to strip the core operating system down to bare bones, as does the upcoming IBM Workplace OS, and relocate as many system services as possible outside the kernel. Indeed, one of the strengths of microkernel design is that modules, including servers that represent emulations of other operating systems or "personalities," can be added to the operating system without disturbing the kernel.

Windows NT and Workplace OS locate the "personalities" outside the kernel, but Workplace OS has a more minimal microkernel and activates more services through messaging. The Workplace OS microkernel can run on clients and process messages for services that may exist out on the network rather than on the client.

Taligent from Apple/IBM will also borrow heavily from the Mach 3.0 example. Other microkernel operating systems are being worked on by the Open Software Foundation, Unix System Laboratories and Sun. These parties sense the value of a tightly knit, highly modular system. The microkernel of Workplace OS will amount to just 35,000 lines of code, Loucks says, compared with 12 million to 15 million lines of code in standard Unix.

Windows NT, however, will offer networking and performance advantages and will display an affinity for Windows clients, but some microkernel flexibility was sacrificed along the way.

## IBM faces tough sales

Some customers bemoan loss of dedicated sales force

By Johannes Ambrosio

IBM is accelerating the move to outsource part of its sales force—and some affected customers do not like it at all.

IBM has had the so-called agent program—which replaces dedicated salespeople with independent sales agents—since place since 1988. But as the size of IBM's sales force has dropped through downsizing initiatives in the past few years, the agent program has assumed more importance as a way of reaching customers with 100 to 1,000 employees.

### Agents share

Today, about 25% of IBM's revenue from small to medium-size accounts is generated by agents, according to Doug Krebs, director of channel management and strategy; the rest of the small-business revenue comes from remarketers and other IBM sales channels. By the end of the year, IBM's goal is to generate about 30% of that revenue from agents.

But some of that growth may come at the expense of customer satisfaction. The issues, as customers see them, include discomfort with buying from a middleman who does not know their business as well as their IBM sales representative and frustration at not always being told when their account has been turned over to a non-IBM sales representative.

"Part of my concern is that I spent \$175,000 on hardware last year, and I feel IBM owes me more of a commitment than an agent."

Said Bob Wagenaar, director of MIS at Silgen Containers Corp. in Woodland Hills, Calif. He said he discovered that his previous IBM sales representative was no longer assigned to his account when he tried to call and get a voice-mail message that her job had changed. He is waiting to hear whether he has an IBM agent assigned to his account or whether he will be dealing with an agent only.

Purst McEneaney Co., a livestock feed manufacturer in Freeport, Ill., was also unknowingly turned over to an agent, according to Mick Calhoun, director of information services. The other problem, he said, is that his agent specializes in AS/400s—but his shop runs a 386.

"When we used to have an IBM sales rep call on us, he used to bring us ideas," Calhoun said. "He would understand our business as best as he could and not just ask us what we wanted."

Wynn Oil Co., a Systems/36 shop in Azusa, Calif., also deals with an agent. "I don't see what

the agent is accomplishing," said Richard Rosenblatt, director of information systems. "It's an extra body in there."

Krebs responded that IBM's quarterly surveys show that users are as satisfied with the agent channel as they are with IBM sales representatives. Regarding the turning over of customers to an agent without informing the customer, he said, "The coverage of any account is a local decision. It is up to the management in each of IBM's geographic trading areas as to which customers receive agent vs. IBMers."

Not all customers are unhappy. David Pinkus, manager of MIS at Fuller Co. in Bethlehem, Pa., said, "We're getting better service now than we did with our IBM rep. We went for a while not knowing who our rep was." Now Pinkus said the agent brings in appropriate IBMers for him to talk with, most recently for an imaging project.

Like it or not, agents are a fact of life for some shops. "It's aimed at the low end of the market, where IBM has gone in and ignored our account to have a Bina suite call on a client," said Gartner Group, Inc. analyst Bob Puffer.

Paul Smith, general manager at Computer Aid in Allentown, Pa., and one of the agent firms with which IBM does business, agreed. "Face-to-face marketing is expensive. Our overhead is less than IBM's."

### Big numbers

IBM is working with 450 agent companies—which represent IBM only—in 100 territories throughout the country. "Tens of thousands" of customers are called on by these agents, according to an IBM manager.

## Oracle offers software for superhighway

By James Daly

Oracle Corp. last week unveiled its plans to pave the information superhighway with a new set of software products that will bring interactive services to the home.

Oracle will offer a line of software from the central server that stores and retrieves a vast stream of video information on the television. A set-top box will allow it to resemble a TV but act like a computer. Central to that plan is Oracle's Media Server, a digital multimedia library that stores and retrieves video and audio images.

Oracle last week announced 30 set-top box

makers that will develop software for its Media Server, including Apple Computer, Inc., RAM Mobile Data, Sharp Electronics Corp., Kaleida Labs, Inc., Motorola, Inc., Scientific Atlanta, Inc., Siegs of America and The 3DO Co.

Corporate users are going to be important paying customers on the information superhighway.

"There's probably going to be a bigger impact on the office than the consumer," said Oracle President Lawrence Ellison. "You can show up at the office and have meetings with your coworkers without ever leaving the office."

Ellison said an interactive TV set-up will cost about \$800 for the average home.

## Notes potential

CONTINUED FROM PAGE 1

aware of anyone that gets 15% royalties on anything," one analyst said.

"It opens a whole realm of possibilities that we didn't have yesterday," said Gary Clare, director of the technology competency group at professional services firm Coopers & Lybrand in New York. For example, the company could use Notes to broadly distribute tax information, he said.

"We could use our existing Notes servers and databases to link to suppliers and other business partners," said Richard Lester, vice president of information services at Associated Grocers, Inc. in Seattle.

According to Lester, public network Notes servers could make electronic data interchange (EDI) transactions more efficient because "it would give us the ability to do things like [use] E-mail to explain complicated documents."

**The punch list**

However, before the AT&T service and new Notes client are available, the companies must finish hammering out details of the arrangement and address outstanding technical issues.

For instance, Notes has built-in security, but accounting and auditing mechanisms would have to be added before it could serve as the basis for public on-line services, said Patricia Seybold, president of Patricia Seybold Group in Boston.

Also, before a public version of Notes could be used for EDI-type commerce, Lotus would have to improve its ability to automate business-critical transactions and support existing EDI standards for forms formats, Seybold said.

Furthermore, with on-line services such as America On-Line and Prodigy thriving, and Apple Computer, Inc. and Microsoft Corp. expected to come to market with various on-line services, Lotus and AT&T will be entering an increasingly competitive market. Some observers are questioning what their value-added will be.

"Even though Oracle and Microsoft [groupware products] are behind Lotus', Oracle still provides a much better database architecture for this sort of thing—by light years," one Wall Street analyst said. "Lotus is already talking to Oracle about making the Oracle database snap on to Notes."

**Joining the crowd**

Lotus has similar arrangements with other service providers. For instance, CompuServe and Wolf Communications Co. already offer Notes back-end messaging and database replication services. However, the AT&T support and the Notes new client could significantly ramp up Notes use.

Several large Notes sites said they expect that the availability of several service providers running Notes networks will reaffirm their decision to buy into Notes. The emerging market should spur competition and, hopefully, reduce price

as the customers said.

"Companies will be interested in this for the same reason that people use value-added networks today: for companies that want to communicate with each other but don't want to put leased lines in," said David Taylor, vice president of electronic commerce strategies at Gartner Group, Inc. "It's been happening using EDI and E-mail for years. Notes seems new because it's a LAN-based phenomenon," Taylor added.

For Notes power user Price Waterhouse, the "lite" Notes client is exactly what the company has been demanding from Lotus, according to Sheldon Laube, national director of information and technology at the firm's Menlo Park, Calif., headquarters.

"We have a whole program to share our information with our clients using Notes. This year, we're hooking up 1,000 customers, and having a stripped-down version for people who want to read and

write to our databases and not bother with the applications functions sound terrible," Laube said. How terrible it is depends largely on the price of the new Notes client, he added.

Additionally, the real value lies in off-loading data center functions for supporting 1,000 customers, Laube said.

Senior editor Ed Scannell, senior writer Michael Fitzgerald and Midwest bureau chief Edna Becker contributed to this report.

## Disaster Recovery for PC's and Networks to Mainframe Where it is Safest

**PC Backups**

FDR/UPSTREAM will backup and recover LAN File Servers (NOVELL® NetWare®, IBM® LAN Server, Microsoft® LAN Manager and BANYAN® VINES®); disks on DOS, WINDOWS™ and OS/2® Workstations on a LAN and the disks of PCs connected directly to the MVS Mainframe.

**One PC can Backup an entire Network**

FDR/UPSTREAM allows a single PC to backup and recover the disks of Workstations attached to a LAN without requiring Host communications software on any other Workstation:

**Performance**

FDR/UPSTREAM uses state-of-the-art APPC LU 6.2 communications. Data Compression, File and Network handling techniques assure the fastest possible transfer to the Mainframe.

**Data Security**

On the Mainframe PC backup files are written directly to tape or stored on disk which can then be staged to tape at a later time.

**Unattended Operations**

FDR/UPSTREAM can run off-shift—performing Incremental or Archive backups from unattended Workstations.

**USER FRIENDLY PRICING**

For example: Low entry Price of \$12,000... purchase FDR/UPSTREAM for 5 NOVELL File Servers  
For less than \$18 a year each... lease FDR/UPSTREAM for 1,000 Workstations on a LAN

## SNMP

CONTINUED FROM PAGE 1

management systems, which domain managers, each responsible for a particular user or device group, can use to interactively communicate with one another or with a central system. This provides scalability and resolves wide-area network traffic issues that arise when a sin-

gle SNMP-based management system must continually poll all managed devices across the enterprise.

The manager-to-manager Management Information Base (MIB) specifies how network management systems should distribute polling, threshold and alarm functions among different machines. It is a key first step for building scalable, distributed management systems in a standardized way because it helps minimize network traffic, accord-

ing to Internet Engineering Task Force (IETF) developer Steven Waldhauer, who is also a manager of network development at Carnegie Mellon University in Pittsburgh.

But of the leading network management platforms, only SunConnect, Inc.'s SunNet Manager 2.2 has any SNMP 2 features now, and those are limited to bulk data retrieval capabilities. Hewlett-Packard Co. and IBM have said they will add some portions of SNMP 2 to their

platforms, HP within a few months. However, none of the major vendors have committed to supporting SNMP 2's manager-to-manager MIB.

Lack of support for the MIB suggests that users with management platforms from multiple vendors could be stuck with no way to allow those platforms to share polling and alarm information.

In the state of Utah government office, several agencies are shopping for network management platforms independently, according to Roien Yoshinaga, a director of information technology for the state of Utah Administrative Office of Courts in Salt Lake City.

"Right now we're the network management pioneers, but as the other departments move forward, I suspect interoperability will become a big issue," Yoshinaga said.

However, even if the vendors decided to implement the manager-to-manager MIB, a common database format is needed to spur interoperability beyond shared alarms. Vendors have not begun working on that, said John McKenna, an IBM NetView/8000 senior programmer.

## What's the holdup?

Interviews last week revealed a variety of reasons for vendors' leisurely SNMP 2 implementation schedules.

SunConnect chose not to implement the security features because the encryption technology is restricted by the federal government under its export controls, and the company did not want to develop separate domestic and foreign software versions, according to a SunConnect spokesman. Sun did put the security code into SunNet Manager and will activate it if it can resolve the export issue, he added.

HP and IBM said their customers have not demanded the capabilities found in SNMP 2. But Shirane, an IBM NetView/8000 user, said, "They never asked us if we wanted those features."

Although the SNMP 2 specifications were published in 1992, vendors cited the lack of a finished standard as a factor in the delay. "That's a red herring," Waldhauer said.

"The IETF standards process is different in that draft standards are intended for implementation rather than comment," he said. The standard is completed before it is sent to draft form, and the rest of the standard process is a formality, he said.

No good alternative methods exist for addressing the security and performance problems. And while vendors can use proprietary technology to add distributed capabilities, that exacerbates interoperability problems, according to Steven Morgenstern, vice president at Unified Systems Solutions, Inc., a systems integrator in Mountain Lakes, N.J.

While SNMP 2 shows promise in solving the issues, Morgenstern said, it has some drawbacks. For instance, the authentication and encryption solve security problems but add several layers of complexity to the administrator's job, he said.

## Guess What Happens When You Off-Load Development With A "Micro Focus."

Issues like off-loading development and right-sizing are far too important to approach with a limited "micro focus."

You need a macrofocus and a comprehensive, integrated solution like CA-Realia II Workbench. It's the first totally integrated, comprehensive GUI-based approach that combines point-and-click ease of use with all the industrial-strength components you need.

CA-Realia puts it all at your fingertips in a single, integrated interface: mainframe connection, lifecycle manager, compiler (the fastest in the industry according to *Computerworld*), analyzer, debugger and CICS emulator. And CA-Realia is more flexible, so you

can off-load development at your own pace with safe, proven technology and an experienced partner. Unlike Micro Focus,

CA is a proven leader in mainframe development. With over 10 years experience and tens of thousands of clients around the world, we can help you make off-loading development safe, productive and predictable.

For A Free Information Booklet Call 1-800-434-REAL, Dept. 26102.

At \$2,500 CA-Realia is less than half the price of the equivalent product from Micro Focus, so why spend more to get less? Choose CA-Realia and get twice the product—at half the price.

Or choose Micro Focus and take your chances.

# Pennies From Avalon

THIS MUG WILL  
SAVE YOU MILLIONS!

We've been so successful reengineering companies all over the world from their legacy MRP systems and into total Enterprise Resource Planning (ERP) with our time-based manufacturing applications, that some of our competitors will go to extreme lengths to keep us from getting your business. Which brings us to this offer.

Just leave our complimentary coffee cup on your desk so our competitor's salesperson can see it, and you'll be amazed at how flexible everyone suddenly becomes. Of course, you might decide to join with GE, IBM, Motorola, Panasonic, SAAB-Scania, VW and Yamaha ... and get a lot more than a free mug from us.

But either way, Avalon will save you a pile of pennies that might stretch all the way to the moon. Call today for your free Avalon mug. And be sure to indicate whether you need a left-hand or right-hand version. So the person across from you will see our logo. And on your side is a checklist of factors critical to your success.

## News Shorts

**Kroger puts Heschel in new role**

Kroger Co. last week promoted Michael S. Heschel, 53, to the position of senior vice president of information systems and services. Besides directing IS, Heschel will coordinate programs in logistics and re-engineering for the Cincinnati-based supermarket chain. He served as chairman of Security Pacific Automotive before joining Kroger in 1991.

**Bug gives ATM users rude shock**

A software glitch in Chemical Banking Corp.'s automated teller machine (ATM) network in New York last week caused double-posting of withdrawals and deposits. In all, 150,000 accounts were affected. Systems modifications made to the ATM network caused the 12-hour snafu, according to a Chemical Banking spokesman. Customers who made a \$100 withdrawal from a Chemical Banking ATM found that a \$200 charge had been posted against their account, the spokesman said. The problem had been corrected by late last week, and all customers accounts would be rectified, he said. The spokesman added that the problem will not result in any loss of customer or bank funds.

**Novell to promote common UnixWare**

Novell, Inc. is expected to announce the formation of an industry group this week that will promote its UnixWare operating system as a single set of binary-compatible system code for a variety of Intel Corp.-based computers. Among the firms likely to join Novell are Unisys Corp., AT&T Global Solutions (formerly NCR Corp.), and ICL, all of which license UnixWare source code. Novell last week also confirmed earlier reports that it is in discussions with several vendors about the outright sale of Unix source code rights.

**Computer role cited in housing bias suit**

Proponents of Places to Live, Inc., an East Meadow, N.Y., apartment referral service, were sued last week by the New York state attorney general for allegedly manipulating computer programs to deny information to minorities about housing in white neighborhoods. Places to Live owner John McDermott was accused of programming his company's computer to indicate the ethnic background of prospective tenants and landlords, along with the biases of the landlords.

**Cincom enters imaging market**

Cincom Systems, Inc. last week introduced a document imaging and signature-capture product for hospitals and physicians. Called Docview, the system is the first imaging application from the Cincinnati software firm. Docview is the result of a partnership between Cincom and Dolby and Co., also located in Cincinnati. Docview runs on most mainframe platforms and offers an interface to most medical computer systems, according to Cincom. The software ranges in price from \$45,000 to \$150,000.

**SHORT TAKES** Digital Equipment Corp.'s full product catalog will now be available for free to educational and research customers over the Internet, the company said last week. IBM Systemhouse, Inc. has announced that it won a five-year, \$27 million job to provide Greyhound Lines of Canada Ltd. with information systems and network management, application development, maintenance, support and a help desk. ... Rich Kirby was named executive vice president of operations and information services at Graf Pay-Pay-View, Inc., a New York-based cable TV service. Kirby was formerly vice president of operations.

# Computing for the gold

By Jean S. Bosman

Lillehammer, Norway, was transformed into a high-tech computing wonderland last week as computers churned out statistics, athlete biographies, building blueprints, digitized television images and on-site security system clearances for the Winter Olympics.

For the most part, it was tried-and-true mainframes running the show. IBM, which donated time and equipment to the Olympic effort, relied on about 3,000 PCs tied to System/390 mainframes in Oslo running CICS to provide core information systems.

"We're using NetView on the mainframe for surveillance of the [ISNA] network," said Oystein Wall, the IBM senior systems engineer and 26-year company veteran who is managing the data center and ISNA network at Lillehammer.

Journalists were able to use an IBM PS/2-based Commentator system through a four-screen interface. The same system could be accessed through IBM PCs in Paris and Tokyo, IBM said.

A large IBM AS/400 was the focal point of Olympic data processing for ticketing and transportation applications in Lillehammer.

An Olympic commentator uses a four-screen PC at Hamar Olympic hall in Lillehammer.

**Not the only one in the race**

IBM was not alone in bringing computers to the Olympics. A video production company used a Silicon Graphics, Inc. Unix-based Crimson Reality Engine to create the TV graphics used by CBS Sports in broadcasting the games.

And, not to be outdone, Sun Microsystems, Inc. sold 100 Sun SPARCstation 10 machines to the Olympic security force. The workstations host geographic information systems that display the location of vehicles on the ground using satellite global positioning systems.

Back in California, Sun linked an Internet server at its Mountain View headquarters to the Norwegian Olmsted electronic bulletin board, which is broadcasting Olympic game results across the Internet. At last count, the statistics server was handling 6,000 connections an hour.

## Powersoft offers low-price desktop

By Melinda-Carol Balou

Powersoft Corp.'s push into the desktop terrain controlled by Microsoft Corp. and Borland International, Inc. received a thumbs-up from users and analysts queried last week.

PowerBuilder Desktop is a development tool with the functionality of PowerBuilder 3.0, but it bundles the Watcom SQL database and allows access to PC databases such as Borland's Paradox and Microsoft's FoxPro. The tool ships next month at a promotional price of \$249.

This new iteration of PowerBuilder fills a gap for Powersoft and desktop developers seeking a low-end client/server offering that can scale up the enterprise as development needs demand. For example, pre-existing desktop applications for dBase or FoxPro will be able to easily move over to the PowerBuilder development environment using the new tool.

The Powersoft announcement "is important because it offers scalability from the desktop to the higher end," said Ron Schaefer, director of research and development at Union Pacific Technologies, Inc.

And so desktop developers require support for a range of databases beyond the desktop, they can add PowerBuilder's TeamODBC kit, which provides database connectivity indirectly through Microsoft's Open Database Connectivity (ODBC) standard. Or they can bring in the Powersoft Enhanced Database tool kit, which offers native support for a range of corporate relational database management systems.

To fill out its high-end packaging strategy, Powersoft will price PowerBuilder Enterprise at \$3,360, which includes PowerBuilder Developer Toolkit, PowerBuilder Application Library and Watcom Image Editor, along with the products mentioned above.

Corporate IS managers were pleased with their ability to use Powersoft's low-cost, low-price prototype and development applications.

"In the past, we had people prototyping in Visual Basic, and then we had to redo everything in PowerBuilder," said Patty Passadori, manager of financial

Powersoft's PowerBuilder Desktop allows access to the Watcom SQL database through Data Windows.

and accounting systems at Charles Schwab Corp.

Industry analysts said Powersoft's new offering is well-positioned. "The higher-end tools from vendors such as Oracle and Sybase are overkill and too expensive, while the low-end FoxPro environments have ease of use and low cost but lack reliability and performance," said Rich Finkelshtein, president of Performance Computing, a Chicago consulting firm. "PowerBuilder Desktop offers a simple front end and simple back end with an upgrade path. I expect it to do very well in small to medium organizations."

Blue Sky ships new version of WindowsMaker. Page 68.

## Distributed computing

# Wells Fargo tags DCE for bankwide project

By Jean S. Borman  
SAN FRANCISCO

Having put the Open Software Foundation's (OSF) Distributed Computing Environment (DCE) through its paces for six months, Wells Fargo Bank is poised to build a bankwide application for accessing customer accounts from a network of distributed servers.

If all goes as planned, some DCE "cells" could go on-line with a client/server or customer support application later this year, said Tevi Gal, vice president of information technology at Wells Fargo. Senior executives still have to approve the project.

## Safety net

The benefit to the bank is that customer account data could be replicated in several servers, preventing any one server from causing systemwide downtime. Even in the event of an earthquake, loan officers, tellers and customer service personnel throughout California could access customer data without knowing which mainframe or Unix server holds those records.

Wells Fargo wants to enhance central-site mainframe storage of all customer records with replication of customer data in several

servers across the network, said Finn Kato, a consultant at Life Computer Systems in Pleasant Hill, Calif., which was retained by Wells Fargo to build the prototype DCE network.

Eventually, DCE technology would also allow larger applications or databases to be split among several servers, he said.

The DCE technology is the linchpin of a wide-reaching client/server architecture that includes PCs, Unix servers, and mainframes. DCE will allow distributed computing to be intertwined with central-site data processing.

"We're at the verge of a new technology," Gal said. "The cost of doing it is going to be large, but the costs of

not doing it may be larger." If the bank makes a mistake in implementation, the new technology would be a liability instead of a competitive edge, he said.

## Better late than never

Full-scale production at hundreds of bank branches in California would begin in time.

"It may be two to three years before it's over," Gal said, "but we will definitely want to start in 1994." Going into production will be contingent on the approval of Wells Fargo senior management.

which will get a formal presentation of the DCE project and plan in March, Gal said.

According to the DCE plan, PCs and Unix workstations in Wells Fargo offices and branches will dial into DCE's software directories to request information without specifying which servers hold the target data. After IBM ships DCE support for its MVS mainframes, DCE will also link with Wells Fargo's other IBM and Hitachi Data Systems Corp. mainframes, providing enterprise-wide access to data.

## Clearing the hurdles

Several technical challenges must be overcome before Wells Fargo puts DCE applications on-line. Developers are looking for fail-safe ways to give unique names to users and account numbers. The bank is also waiting for better systems management and security utilities. Expected when the OSF ships DCE 1.1 (see box below), Gal said.

The Customer View Reference application will access data stored in mainframes under IBM's DB2 relational database and data stored in IBM RS/6000 and Hewlett-Packard Co. Unix servers un-

## Opportunity knocks

Some DCE sites are already moving pilot applications into limited production, according to the OSF in Cambridge, Mass., which wrote the DCE source code. "Most of the people committed to DCE have the lab, and they've done their initial testing," said David Leunburg, director of distributed environment engineering at the OSF. "The next step is to put some mission-critical apps and try them out in a production environment."

der the Oracle Corp. relational database (see chart).

During the next 10 years, most U.S. banks plan to surround mainframe-based legacy systems with new client/server systems, according to Diego Teixeira, president of The Tower Group in Wellesley, Mass.

Other DCE sites are going on-line, said Ted Haass, president of the OSF's end-user steering committee. Charles Schwab & Co. in San Francisco installed one DCE cell in its Phoenix offices late last year [CW, Dec. 6, 1993].

"Schwab and Citicorp are rock-solid, conservative companies that depend on computers to move money around," said Haass, who is installing DCE applications at the University of Michigan at Ann Arbor [CW, Jan. 10]. "If they're committing to use DCE, then it's not just the leading edge that believes DCE will enable the kind of distributed computing users want to do."

# Poor man's ISDN wins support

## Protocol can combine data, voice on a single line

By Stuart J. Johnson

Microsoft Corp. and a slew of telecommunications industry players last week endorsed a protocol that may provide a sort of poor man's Integrated Services Digital Network (ISDN).

The protocol will be built into modem chips and will let users exchange electronic documents and bit maps over a single standard phone line while a voice call is in progress.

VoiceView, developed by city Radish Communications Systems, Inc. in Boulder, Colo., is a switched protocol that allows two enabled modems to put the voice portion of a call on hold long enough to transfer data and then switch back to the voice call.

"I would drag a file [I wanted you to see] and drop it onto a telephone line" in Windows, said Aaron Getz, technical strategist at Microsoft's digital office systems group.

"You'd hear a chirp, like a call-waiting tone, be put on hold briefly and then an icon would appear" on your system, Getz said. It would take about six seconds to send a two-page Microsoft Word document, one second for a business card and at least 10 seconds for a full-screen bit map, he said.

"We invented a product that would do many of the ISDN things now," said Dick Davis, chairman and chief technical officer at Radish Communications. The company has been shipping dedicated devices that accomplish these functions since 1992.

## Big time-saver for customers

Oppenheimer Shareholders Services, Inc. in Denver put about 50 VoiceView sets in broker offices in November 1992. Said Pat Lovett, vice president over dealer telephones at the mutual funds company "We would send [the brokers] screens of information about their clients and about our mutual funds. It was really easy because they didn't have to wait for a hard-copy statement," Lovett said.

Last week's announcement included endorsements by a major manufacturer of modem chips, Rockwell International Corp., as well as by major modem vendors such as Hayes Microcomputer Products, Inc., Intel Corp. and U.S. Robotics, Inc.

The first modem products to incorporate VoiceView should appear this summer. Modems using the technology are expected to cost little more than existing modems.

## More good stuff to come

**D**CE code supports coordinated processing throughout an enterprise by providing network-based directories of files, security software and systems management utilities. Version 1.1 of DCE, which is scheduled to enter beta testing this spring, will provide additional systems management and security features to help users build commercial-grade DCE applications. However, users will not receive DCE 1.1 tool kits from systems vendors until late 1994 or early 1995.

DCE 1.1 includes better security features, an auditing capability, a unified systems administration utility for all DCE modules and a new scripting language that lets users customize DCE systems management and security. One new feature allows applications to be translated for use in various written languages besides English, including Japanese, said David Leunburg, director of distributed environment engineering at the OSF.

DCE 1.0.2 is available for Unix systems from IBM, HP and Digital Equipment Corp., IBM's OS/2, Microsoft Corp.'s Windows 3.x using a tool kit from Oracle Technologies, Inc., and Sun Microsystems, Inc. machines using Transarc Corp.'s DCE tool kit.

## License reforms

CONTINUED FROM PAGE 1

enterprise licensing agreements fit into our business at the present time," said Jim Gray, group vice president of MIS at Service Merchandise Co. in Nashville. "We're looking at our long-term strategies for rightizing, and we're just not sure where we want to be five or seven years from now."

### Slow to take the bait

Users have been reluctant to adopt the alternate licensing offered by vendors such as Computer Associates International, Inc. and Legat Corp. because the deals are not dramatically different from the tiered pricing mechanism, one analyst said.

With a few exceptions, nearly all the new licensing schemes are still basically priced by the size and power of the processors used to run the software, said Bill McNeely, vice president and service director at Gartner Group, Inc.'s Software Asset Management service in Stamford, Conn.

McNeely said MIPS-based and enterprise licensing deals have begun to address user needs for systems software budget predictability, ease of administration and adequate price/value relationships, but he added that the current models are only a starting point for future licensing options, such as usage-based pricing.

### Tierless structure unpopular

CA executives said most of their systems software license renewals and new customers continue to opt for the tiered pricing structure. To date, CA has signed fewer than 100 of its largest customers to enterprisewide, MIPS-based agree-

Seagram's Jack Cooper: A global software license was cheaper than maintaining licenses at 45 separate sites

according to Arnold S. Mazur, a CA executive vice president.

Under CA's tierless license, customers pay a one-time CPU upgrade charge for software equal to 1% times the base license. For example, if XYZ Corp. paid \$100,000 to license CA-1 on an IBM Group 50 machine and were to upgrade to an IBM Group 60 mainframe with a base license fee of \$120,000, it would pay a one-time \$60,000 surcharge to upgrade the software. But after paying the combined \$180,000 fee, XYZ would never have to pay another upgrade charge for the software should it again move to a higher processor.

Most users who have entered into MIPS-based and enterprise licensing agreements with their vendors were upset about the deals. Spiegel, Inc., a Downers Grove, Ill., catalog and retail fashion distributor, has signed MIPS-based perpetual licenses with Book & Baggage, Inc. and Legat during the past six months that have protected it from CPU upgrade charges, said Nick Iozzo, technical services manager at Spiegel.

### Not accepted yet

Given customers' reluctance to embrace alternate licensing options, CA has taken a cautious approach to IBM's metering technique, though it supports the initiative. "Just because there's talk about metered pricing doesn't mean the marketplace will accept it," Mazur said.

Chief information officers at several large multinational IS shops said their preference is to sign global software licenses to ease the administrative complexities of maintaining separate geographic licenses. However, most independent software vendors have been unwilling to sign global agreements, according to Jack Cooper, CEO at Joseph E. Seagram & Sons, Inc. in New York.

Seagram has been able to land just one global software license during the past two years — for IBM AS/400 financial applications provided by J. D. Edwards & Co. in Denver. That contract, signed in 1992, has been a boon for Seagram. Cooper said, because the spirits distributor has managed to retain control of its AS/400 software while ensuring localized service.

"From our standpoint, it has enabled us to deliver MIS services much more effectively at a lower cost on a global basis to our 45 divisions," he said.

Previously, the firm had higher administrative costs from maintaining a plethora of geographically dispersed J. D. Edwards licenses.

### Latitude means savings

Spiegel, which runs a six-processor, 315-MIPS IBM ES/9000 Model 962 mainframe, will likely upgrade from the Group 90 machine to a

Group 100 box by year's end. Because the company was given "latitude" by Legat and Book & Baggage to pay upgrade charges only when its CPUs move up in 100-MIPS increments or more, the retailer's software fees will not rise if it moves to a seven-processor, 365-MIPS machine. And

Spiegel will incur only minor upgrade charges if it moves to an eight-year, 400-MIPS mainframe, Iozzo said.

Iozzo said he expects the retailer will save \$50,000 during the course of the two perpetual license agreements. "The Book and Legat contracts have protected us from the rapid corporate and MIPS growth that we're having," he said.

Still, Iozzo and other users said they are keeping a keen eye on IBM's metered pricing developments. Usage-based pricing "would allow us to get into products that we don't have a big use for today," said Adolph Kalan, manager of operating systems support at Royal Bank of Canada in Toronto.

Senior correspondent Gary H. Anthes in Washington contributed to this report.

## Don't look to Big Blue yet

Don't expect usage software pricing from IBM — at least not for a while. An IBM manager acknowledged that the company's initial foray with customers was considerably off target, and IBM will continue to experiment before offering anything formal.

Although the company will continue to work on usage pricing, which measures and charges by how much of the processor the software actually uses, for now the focus will be on per-use or per-processor pricing models, said Linda Hubbard, IBM's manager of software business systems. Operating systems will continue to be priced on the tiered model for the foreseeable future, she said.

IBM is also continuing to offer its Enterprise Agreement for Software, a three-year contract that gives users large customer breaks, including free version upgrades and the ability to add new software without paying for it until contract renewal time. IBM announced this agreement, along with its intention to provide usage-based and asset pricing, at a customer conference in Chantilly, Va., last May.

On the measured usage front, Hubbard acknowledged that IBM's initial tests with 800 customers worldwide were off base. "We had taken an approach that would have ended the measurement tools in the software itself," she said. "Now we realize we have to embed the measurement tools in the software itself."

IBM does already have a measurement tool called System License Management (SLM) that it uses in some of its mainframe packages, but Hubbard said IBM "is not as open as we would like it to be, so we're still looking around for a measurement tool. The goal is to work with other software vendors so there is some level of standardization in the industry," she said.

Lari Puma, president of the Technology Board of Trade, an consulting firm in Los Angeles, Calif., said IBM's inability to provide true metered pricing for a while will not likely have an immediate impact on the industry because most users are not moving to that model right now anyway. Longer terms, she said, the priority for vendors should be to stabilize the costs of every software vendor of having a different license manager. To the extent that IBM can do that, it will help users down the road.

—John A. Ambrosio

Source: Computerworld Database Division, Indianapolis, Mass.

ments, among them General Electric Co. and Citibank NA, according to analysts. And none of CA's customers have signed up for the vendor's "tierless" licensing plan since it was enacted 22 months ago.

# Novell, Intel team up on network management

By Elisabeth Horvitz

Novell, Inc. is extending its NMS 2.0 into the desktop management domain by incorporating Intel Corp.'s LANDesk Manager application suite into its NetWare Loadable Module (NLM) based architecture, the vendors announced last week.

NetWare Management System (NMS) users will be able to initiate LANDesk Manager applications, including virus monitoring, automated backup, inventory and LAN traffic monitoring, from the NMS Windows console, company spokesmen said. Furthermore, NMS and LANDesk applications will be able to communicate.

For example, Intel's traffic monitor can alert NMS of an overloaded LAN; and NMS, alerted to a mirrored disk failure, can tell Intel's StorageExpress application to back up the primary disk, said Mike Maerz, a general manager at Intel.

This represents integration on a deeper level than Windows-based management systems such as Novell's have provided so far, according to Jill Huntington-Lee, a principal at Brandywine Network Associates, a consultancy in Clifton, N.J. However, Novell still does not enable different management applications to exchange data, as is possible on Hewlett-Packard Co.'s Unix-based OpenView. Huntington-Lee pointed out, Novell has promised database-level integration in the future.

Intel has announced that LANDesk Manager will support OpenView as well but did not commit to a date.

## Hello, there

While NMS can do limited PC management, such as seeing what PCs are on the network and who is logged on, it needs LANDesk Manager to "go down and figure out what type of PC" or determine what peripherals and software versions are installed, said Mark Livings, manager of distributed computing services at Quaker Oats Co.

NMS even needs Intel's product to monitor NetWare servers, Livings said. The current Novell management system "relies on an agent on the server to tell if the server is up or down, and when the

server goes away, the agent goes away," he said.

In contrast, LANDesk Manager has a server monitor, a dedicated PC whose sole job is to "say hello to each server every 30 seconds," Livings said.

Quaker Oats currently uses both NMS and LANDesk manager, as separate products. Integrating the two will enable

LAN administrators to initiate the management functions of both offerings from a single console, eliminating the "revolving chair" type of situation, he said.

LANDesk Manager is the first third-party product to become an NLM within NetWare Distributed Management Services, the next generation of NMS.

NMS 2.0 is priced at \$2,495. Intel's "snap-

in modules" for NMS are scheduled to ship next month and are priced as follows: LANDesk Manager 1.51 costs \$1,495; LANDesk Virus Protect 2.1 costs \$695; and StorageExpress 1.21 costs \$4,995 to \$12,495.

Intel will sell NMS integrated with its StorageExpress backup system as a separate product.

Novell plans full NetWare for the Macintosh. See page 47.

## LANding gear

LANDesk Manager includes the following modules:

- Automatic backup, either scheduled or event-driven.
- Virus protection that scans individual PCs.
- Elements control and view of a PC from a central console.
- Information collection on PCs' software and hardware assets.
- Application traffic tracking on local segments.

All LANDesk applications are supported on DOS and Windows PCs; virus, inventory, and scheduled backup applications are supported on the Macintosh and OS/2.

There's only one place  
you'll find servers  
better than ours.

Ever wonder why they call them servers when it seems like most of the time you're the one doing all the serving? At Compaq we felt it was time to put the service back in the servers. Make them easy to manage. Dependable. Cost-effective. That's why we've introduced the ProSignia family. Each one is a breakthrough in operational efficiency. Each one is more feature-packed and price-to-performance-focused than anything else on the market.

TriFlex/EISA architecture. Hot-pluggable storage. Proactive server management software. CD-based installation. Full-Spectrum Fault Manage-

ment. Just a few of the things that go into every ProSignia server we make.

Imagine intuitive software that makes installs and upgrades a snap. Benefit from innovative management tools that keep close tabs on server status, help prevent faults, warn of impending problems, and even take corrective action without intervention from you. Rest easy with rapid recovery and backup systems that kill down-time.

For the best resource for Compaq ProSignia servers, look no further than the Intelligent Systems Group of Intelligent Electronics. From initial contact to post-sale service and support, the professionals at ISG are ready to handle all your network challenges. Nationwide.

**COMPAQ**

TO GET MORE INFORMATION ON HOW PROSIGNIA SERVERS AND THE INTELLIGENT SYSTEMS GROUP CAN GO TO WORK FOR YOU, CALL US AT 1-800-757-7177. CALL NOW AND WE'LL SEND YOU A PACKAGE OF THE BEST GOURMET COFFEE THIS SIDE OF BURGESS DRIVE, ABSOLUTELY FREE. NOW HOW CAN YOU BEAT SERVICE LIKE THAT?

## NewsShorts

## IBM shake-ups continue

While IBM's U.S. subsidiary, Ambra Computer Corp., introduced new models two weeks ago and cut prices on select notebook and desktop models last week, the European Ambra was pulled from the market. Officials cited strong sales of products such as ValuePoint and the PS/1 as the reason for pulling the ship. The two units are completely unrelated. IBM officials said they are happy with the U.S. Ambra's performance and have no plans to close it. Meanwhile, IBM's cost-cutting measures continued last week, as the company handed out pink slips to 700 employees at the RS/6000 and Large Systems divisions, as well as at Integrated System Solutions Corp. Furthermore, the company said that 1,200 of 6,200 employees in the Mainframe division would be laid off in the next month or so.

## Sun seeks to bar NSA award

In a desperate attempt to hold on to its largest federal customer, Sun Microsystems, Inc. last week asked the U.S. District Court in Washington to bar the National Security Agency from awarding a \$200 million workstation contract to a rival vendor. A hearing had not been scheduled at press time. NSA had reportedly planned to announce the High Performance Workstation II contract winner last Friday. Sun was originally awarded the contract last June, but the NSA later withdrew that award, citing a bidding irregularity. Sun's performance on benchmarks used in the competition, NSA is believed to be one of Sun's biggest customers.

## Software group cites piracy abuses

Japan, Korea and the People's Republic of China are home to the worst software piracy in the world, according to a report issued last week by the Business Software Alliance. Dollar losses in Japan are the worst in the world, costing U.S. publishers more than \$630 million last year. Korean pirates are estimated to have illegally duplicated \$370 million worth of software in 1993, while the Chinese pulled off more than \$190 million in software theft last year.

**SHORT TAKES** Microsoft Corp. said it will offer support lines for WordPerfect Corp.'s WordPerfect for DOS users who switch to Microsoft's Word word processor.

... IBM said it shipped 250,000 PowerPC 601 microprocessors in the chip's first four months. ... Eighteen software publishers, including Microsoft, Lotus Development Corp. and WordPerfect, have signed up for IBM's CD-ROM software distribution service.

... Following Lotus' recent announcement that it will no longer provide major upgrades for its 1-2-3 spreadsheet on Unix platforms, Applix, Inc. has announced a \$300 competitive upgrade program to its namesake spreadsheet.

... IntelCorp. has, will announce a new set of object-oriented analysis and design tools next week with support for rapid application development and a focus on business modeling. The new Object Management Workbench is the result of collaboration between IntelCorp. and James Martin & Co.

... Anderson Consulting will develop and install a new customer service information system for San Francisco-based Pacific Gas & Electric Co.'s 20,000 "non-core" customer accounts. The client/server application may be scaled up in the future to handle all of PG&E's 7.7 million residential and business accounts.

... Patrick Smith is leaving SHL Systemhouse, Inc. to join Inglewood, Calif.-based Unix developer Locos Computing Corp., and SHL Chief Executive Officer John Olman said an alliance between the two vendors is in the works. Sources said SHL may acquire Locos.

## Unix-based shops consider NT

By Ed Scannell and Stuart J. Johnston

While Microsoft Corp.'s journey to win respect for Windows NT in the Unix market is still an arduous one, the company appears to be getting a fair number of corporate Unix clients to strongly consider its case.

The product appears to be having most of its success among Fortune 1,000 accounts at the departmental level. There, it is replacing various flavors of Unix on low-level servers that take care of file and print services. For the most part, NT has not posed much of a threat to Unix at the high end of the server market.

"We haven't seen NT as a displacement vehicle for Unix [at the high end] yet," said Barnaby Sheridan, a consulting analyst at Sequent Computer Systems, Inc.'s architectures and planning group, which sells both Unix and Windows-based systems. "For the most part, [users] are taking departmental applications like a Microsoft SQL Server or Oracle and

implementing them in a straightforward way over to NT."

"Microsoft will first capture the small Unix server market. Don't forget there are users that run huge Unix boxes with clients, and right now NT doesn't scale up the way Unix does," said Bill Cornfield, president of The Windows

Support Group in New York.

Microsoft officials acknowledge that it has been difficult to sell Windows NT to the highest end of the Unix market because information systems managers evaluate the product in much the same manner as they evaluate miniframes.

Windows NT appears to be faring better lower down in corporate servers, where the workstation cycles are shorter and its practical application is more obvious.

Sheridan and many IS managers said some Unix-based IS shops are considering Windows NT to empower small to medium-size workgroups in ways they find either difficult or impossible to do with Unix.

"We are using NT simply as a

[computer-aided design] file server [and for] mail," said Martin Lindal, vice president of MIS and communications at Seattle-based Lindal Cedar Homes, Inc. Lindal added that his company's mission-critical functions, such as accounting, inventory and material listing, still reside on a pair of Hewlett-Packard Co. HP 3000 machines.

## Saving dollars

Another reason some hard-core Unix IS shops are seriously examining NT for economic gains. With NT, able to run across a variety of powerful RISC-based systems, some IS professionals say they stand to save substantially on porting costs, according to Michael Drips, a corporate developer at a large telecommunications company in Tampa, Fla.

"A lot of Unix shops are going to give this [Windows NT] way because it is cheaper. For instance, if you have 1-2-3 for Unix, it costs you \$2,500 a seat [on a network], which is a huge cost. It's why we're looking to do a couple of our Unix applications," one corporate IS manager said.

## Chicago chock-full of features

Microsoft's beta offers simple configuration, mobile features

By Ed Scannell and Michael Fitzgerald

Microsoft Corp. is expected to only hint at the breadth of Chicago, its follow-on to Windows, at its Hardware Engineering Conference in San Francisco this week. But sources familiar with its plans said the interface will deliver on its promise of Macintosh-like features.

Those features include the ability to support automatic hardware and software configurability as well as a newly completed document-centric interface, the sources said. Users will also have the ability to search for files across a network, and mobile users will find improved features for swapping files quickly between desktop and portable computers.

Plug-and-play capabilities will include the so-called Advanced System feature with which users can set up their system for automatic configuration when they insert add-in cards or new hardware.

The software will notify users of software or hardware conflicts with their current configuration.

The new version of Windows will provide simple features for dis-

playing internal information about a user's system, configuring device and memory priorities, as well as optimize those variables.

The new document-centric graphical interface significantly enhances the three-dimensional effect and makes it easy for users to view. The company has also added a status bar, located at the bottom of the screen, with selections for Run, Task List, Arrange Windows, Arrange Desktop and Shut Down Windows. The program's shutdown feature is almost "exactly the same as the Mac's," one source said.

## More with Explorer

The beta product also contains the Explorer, a built-in utility that searches for and locates specific data files and associated attributes across multiple networks. Explorer was demonstrated at Microsoft's developer conference in December, but as part of Cairn, which is Microsoft's next-generation object-oriented operating system.

Explorer in Chicago differs in that it is integrated into the plug-and-play aspect of the new operating system, according to a development source to Microsoft.

The new interface also features a recycling bin icon in which users can store files that they have no immediate use for but also do not want to discard.

Another new feature is the Briefcase icon that allows desktop users going on the road to drag files and applications to the folder and copy those files to their notebook.

"The nice thing about [the Briefcase icon] is when you return from the road it takes the most current versions of your files and [re-stores] them back to where they were on the drive," one source said.

According to beta testers, the new beta appeared reasonably stable and had good performance running several best-selling 16-bit Windows applications.

One user said he had several applications open along with a video clip on a 60-MHz machine with 8M bytes of memory. "It ran pretty nicely." The same set of apps under OS/2 is a little choppy, he said.

"Some people have criticized Microsoft for not running 16-bit Windows apps as [virtually device machines], but if they can get this sort of performance, what difference will it make?" one source said.

THE LEADER IN OBJECT COMPUTING

# Introducing Borland InterBase 4 The first upsizing server

Today, more business-critical applications are running on desktop systems than ever before. So the need to "upsize" these systems to client/server—for increased security, reliability, and information throughput—is greater than ever. That's why more companies are making the move to client/server with Borland InterBase 4. You get all the data integrity, security and performance of a powerful SQL database server, plus the reliability and ease of use normally found only in PC tools.

Everyone who uses InterBase 4

## USERS

24-hour real-time availability

Familiar tools

## MIS

Consistent

High performance

## Leverage your existing code and knowledge

Paradox® data moves right into InterBase® with only minimal changes to your applications. Users and developers alike gain increased reliability and throughput, while continuing to work with their familiar tools.

And InterBase is so easy to manage. It's self-tuning, and can recover automatically from system failures without the

use of log records. Add to that its small footprint and "point-and-click" install, and you can see why this powerful RDBMS is the ideal SQL database server for deployment throughout your enterprise.

## Fastest response in mixed read/write situations

Borland InterBase 4 is a powerful RDBMS that gives you features like multi-database joins, automatic two-phase commit, stored procedures and triggers. But the real secret to InterBase's performance is its unique versioning engine. It significantly reduces database locking by creating "difference" versions of records as they are changed. So you get the fastest response times in situations where users are both reading data from and writing to the database.

## Users and MIS both win with InterBase

This is one SQL database server that doesn't force you to make trade-offs. End users get the freedom of data access they want while continuing to use their familiar tools. MIS enjoys enhanced security and the ability to maintain the system without having to take it off-line. And everyone benefits from the increased performance. No wonder

customers like MCI and Money Store purchased more than 65,000 UNIX licenses for InterBase last year.

If you're looking to "upsize" your PC or PC network applications to client/server, call Borland today. Because Borland is the "upsizing" company.

Call today for a free videotape and technical white paper.

Power made easy

f

What will keep track  
athletes from over 60 far-  
in 55 Olympic events—  
detailed statistics

of around 1,500 different  
flung countries competing  
right down to those  
we all find so fascinating?

*PCs, workstations and midrange computers, linked to*

## Mainframes, what else?

It's one of the biggest events in the world. And the athletes are only a small fraction of the people involved.

There are coaches, trainers, journalists, maintenance people, security people, you name it—50,000 in all, with a vast array of different information needs.

Obviously, it's critical that everything comes off perfectly during the Olympic Games. Because at this one-of-a-kind, two-week occasion, there are no second chances to get it right.

Which is why the '94 Winter Games have mainframes "serving" the rest of their computer network "clients." It's the only way to handle the almost unimaginable information needs of this monumental event. Like, for example, making sure every local area network and PC

at Lillehammer—2,995 PCs, to be exact—has instant access to statistics, bios, results, timings, not to mention information concerning ticketing, maintenance, food, lodging and a host of other things.

You might say, running the Olympic Games is similar to running a company. Which is why, like so many companies, they depend on mainframes for accessing, managing, distributing and protecting mission-critical information. Because, quite simply, nothing else can do the job nearly as well.

To receive more information on mainframes, call 1 800 IBM-6676, ext. 656.

The IBM System/390®

# Data warehousing: Hot property, tough sell

By Craig Stedman  
ORLANDO, FLA.

While interest in data warehousing appears to be spreading rapidly, information systems executives are still grasping for ways to sell their companies on the central repository concept.

Attendees at the Data Warehousing Conference here last week said the lack of tangible financial benefits such as head-count reductions or time savings pushes most IS organizations to start with small warehouse demonstration projects. Many rely on the operating units that would use the decision-support capabilities provided by a data warehouse to take the lead in lobbying corporate management on its business value.

"The need [for a data warehouse] is there," said Thomas Tunney, director of IS management at the state of Tennessee's Department of Finance and Administration in Nashville. "The difficulty is going to be translating it into some sort of viable cost-benefit analysis. In fact, it's darn near impossible."

"It's not like doing a manufacturing system where you can put a clear-cut savings on it," added Joe Olczewski, assistant vice president of data processing at Maryland Casualty Co., an insurance firm in Baltimore. "When we say the company will be able to put out better reports on how it's doing, that doesn't give you much more than a warm feeling."

## Big money

Olczewski estimated that it would cost about \$1.5 million to build an enterprise-wide data warehouse at Maryland Casualty, a hefty amount for a company with an annual IS budget of less than \$10 million. "Some of the individual loads are \$150,000," he noted. "We're talking a big commitment."

"There is a leap of faith that has to happen" with a data warehouse, said John Sweeney, director of information management resources at Bank of Boston. "I don't think you can go out and justify it from a cost-benefit point of view. It's more the opportunities that it creates for users" by providing end users with improved access to corporate data.

## Warehouse on fire

A recent Meta Group, Inc. survey of its clients showed a meteoric rise in the number of companies working on data warehouses compared with a year ago.

Sweeney added that he spends most of his time "marketing" the concept to other people" at the bank, both on the business side and in the IS department. A pilot project is being developed for use within IS and will be followed later by a second pilot that will involve an undetermined business unit, he said.

Not all IS shops are finding it hard to get approval for a data warehouse. Kevin Leggett, IS project manager at Van Waters & Rogers, Inc., a Kirkland, Wash., chemical distributor, said senior management quickly became interested in opening up data to the company's salespeople.

## Selling the system

"What we really started is that it's an opportunity to collect data on multiple systems and put it all on one platform" that sales could access, Guyon said. Van Waters & Rogers plans to go live with a pilot warehouse for its Portland, Ore., sales area in late March and expand across the U.S. by year's end, he added.

Aaron Zornes, a Meta Group, Inc. analyst in Burlingame, Calif., noted that some IS organizations are trying to generate backing for a data warehouse by building small pilots and inviting users in to test-drive them. "You get users to sign up for it and go to upper management, rather than the IS people proposing it," Zornes said.

Several executives who have succeeded in getting approval for such projects agreed that getting support from business units is crucial.

"The job is to plant the seed," said Rob Collins, advanced technology analyst at Westinghouse Savannah River Co. in Aiken, S.C. The IS department there provided access to small pilots "within a managed situation, so that users could go back to their own groups and market

the concept for us," he said.

"If you can't get a partnership between IS and the business side, my advice would be to wait until you can," said Mark Johnson, manager of data warehouse architecture and planning at US West Communications, Inc. in Denver. Johnson described warehousing as "an enabling capability" that depends on users "to book into the concept and pull it forward."

## Tools to build with

**B**uilding a data warehouse remains a do-it-yourself project. There is no lack of warehousing tools to choose from, but they are mostly point products, and responsibility for combining them into a solid framework belongs to the IS department.

"The weight is on the shoulders of the IS guy to design and build this thing, and that's scary," said Sean Kelly, senior telecommunications business manager at Dublin-based Telecom Eircom, the Irish phone company. "IS is behind the eight ball on this because the pieces are there, but it's not knit together, and the expertise to do that is rare."

Some IS executives said they view the integration requirements as a fact of client/server life. John Sweeney, director of information management resources at Bank of Boston, said it should not be a problem "as long as the tools play together." He added, though, that vendors "are not 100% focused on interoperability."

Meta Group analyst Aaron Zornes noted that building a data warehouse is made more difficult by the lack of robust administration tools that will not be remedied until 1995 or even 1996. IBM comes closest to offering a full data warehouse framework, but it's IBM-centric and requires OS/2 on the desktop, Zornes said.

—Craig Stedman

## Client/server

# Vendors bond on net backup

By Stephen P. Kiet Jr.  
GOLDSTEIN

Users facing the arduous task of managing data backups in client/server environments received a boost last week at Networks Expo. A vendor consortium announced a standard for data interchangeability across multiple platforms and operating systems.

Called System Independent Data Format (SIDF) Version 1.0, the standard evolved from Novell, Inc.'s Storage Management Services (SMS) specification. With SMS-compliant products, users do

not need to upgrade backup software when a new version of NetWare is released, and all nodes on the network — such as Unix and Windows-based clients — can be backed up to a Novell server [CW, Dec. 13, 1993].

SIDF takes this one step further by going outside the NetWare realm and allowing users to interchange tapes, media and files among different backup software packages. For example, data stored with a Unix backup program can be read by a NetWare-based device and vice versa.

While analysts said it would take at least a year for users to see the real benefits of SIDF — only six

compliant products are currently shipping — they were upbeat about the standard's potential.

"Storage management in client/server environments is an onerous task, but this announcement moves the industry forward in terms of reducing user pain," said Chris Christiansen, an analyst at International Data Corp. in Framingham, Mass.

## More to look forward to

Observers said the development of the SIDF standard could lead to bigger and better things for users, such as a standard backup interface to all operating systems and the ability to put backup on any server in a heterogeneous environment, regardless of what operating system it hosts. Several vendors are working on these capabilities, including Legato Systems,

Group effort

More than 50 vendors contributed to the SIDF specification, including Comshare, Perisys, Inc., Digital Equipment Corp., IBM, Chryseus Software, Legato Systems, Palintech Corp., Microsoft Corp., and Sun Microsystems Computer Corp.

Inc. and Chryseus Software, Inc. Meanwhile, the European Computer Manufacturers Association (ECMA) in Geneva has accepted SIDF 1.0 and is in the process of submitting it to the International Standards Organization for approval as an internationally recognized standard.

Users were impressed by the amount of vendor cooperation displayed in making SIDF a standard, but they would still not take switching backup vendors lightly. "I wouldn't make a change just to have a tape format that every one backs — backing up one network with different systems doesn't make sense [for us]," said Michael Kannis, network administrator at St. Paul Reinsurance Management Corp. in New York. "It would take a lot to convince me to try it."

# The Apple Report On PowerPC

## NUMBER 3 — APPLICATIONS ACCELERATED FOR POWERPC

If you buy a Macintosh today, can you upgrade it tomorrow? In many cases, yes. Just look for the "Ready for PowerPC upgrade" sticker on the box.

On average, a Macintosh with PowerPC technology achieves two to four times the performance of 68040 and 68086 machines running the same programs.

If you use applications that do floating-point mathematical calculations, your performance levels could be up to ten times those of the same program running on a 68040 machine — and several times faster than the fastest Pentium system-based computers.

A Macintosh with PowerPC offers unprecedented compatibility between Macintosh, MS-DOS and Windows, thanks to an emulation program called SoftWindows, which licenses Windows code from Microsoft.

For more information about Macintosh with PowerPC, call 1-800-732-3131, ext. 150. We'll send you a free copy of **PowerPC Technology: The Power Behind the Next Generation of Macintosh Systems**. In Canada, call 1-800-665-2775, ext. 910.

The new family of Macintosh<sup>®</sup> computers with PowerPC<sup>®</sup> chips will run virtually all Macintosh system-based software and most current programs for MS-DOS and Windows operating systems. So no matter what computing environment you're working in now, you can migrate to a more powerful desktop computer without losing your investment in your current software.

But the real benefit of PowerPC technology will be seen with new applications optimized to take advantage of the chip's advanced capabilities.

These applications, often called native applications, will offer two to four times the performance of programs available for the fastest Macintosh computers today. Developers writing native applications say that these applications perform at levels better than their Windows counterparts running on Intel Pentium system-based computers.

### Major developers on board.

Right now, the world's leading developers are updating their most popular and memory-intensive programs to take full advantage of PowerPC technology.

In fact, Apple has been working closely with more than 200 major third-party developers since 1992 to create powerful new versions of their applications.

And since software development kits became widely available in January, hundreds of additional developers have begun the move to PowerPC.

PowerPC technology enables them to incorporate new levels of speed and functionality into their applications for the Macintosh system. Developers everywhere are eager to exploit these new capabilities.

— Do more in less time.

What will the advanced capabilities of native applications mean to you? You'll spend significantly less time waiting for your computer to redraw or recalculate or re-anything. That means you'll have more time to create and refine your work, to apply new concepts, to test options.

You can also expect to see new kinds of applications — software that is both more intelligent and easier to use.

Developers will be exploring new features in areas such as intelligent help, 3-D design, video, animation, speech recognition and text-to-speech conversion.

Many of these new functions simply wouldn't be practical without the superior processing capabilities of a RISC chip and innovative Macintosh technology.

### Why RISC?

The new generation of Macintosh computers will be the first personal computers with RISC (Reduced Instruction Set Computing) chips — ultra high performance chips that were previously available only in workstations.

(In fact, many workstation developers are now writing applications for the Macintosh platform for the first time.)

RISC chips are smaller and less complex than comparably powered CISC chips, so they cost less to produce — which means that Macintosh computers with PowerPC technology can offer a significant price/performance advantage. But more important, they'll give you an unprecedented new kind of power.

The power to be your best.

**What programs will be ready?**  
While a Macintosh with PowerPC technology will run virtually all of your existing Macintosh system-based programs, the real benefit of PowerPC will be with applications optimized to take advantage of the chip's advanced capabilities. More than 50 of these native applications will be available in the first half of 1994. Here are some of them:

4th Dimension	FrameMaker
Adobe Dimensions	Intuit Solutions Software

# Imagine Growing Your Novell Storage System More Easily Than Deciding Where To Go For Lunch.

Getting everyone to agree on some things can be tough. But getting them to agree that Digital's

expansion strategy includes about 1GB disk drives and a 4GB DAT drive. As your

sometimes needs grow, you can add or change disk

drives and choose from wide range of tape

back-up devices. For a complete automated

storage management system, you can add

Palindrome Network Archivist 3.0. Imagine

having that kind of control over your external

storage configuration. For more information

on Digital's StorageWorks Deskside

- ☐ Hot swap devices without tools or service calls and without powering down the system.
- ☐ Select from 3.5" disk drives, 4mm, 8mm and DLT tape drives
- ☐ Modular packaging adapts to changing storage needs

yes

manage your LAN storage growth - that's easy. With StorageWorks modular flexible design, you can buy one storage subsystem and adapt or expand it to meet changing storage needs. The 4GB StorageWorks Expansion System for Novell, just call us at 1-800-DIGITAL. To become a StorageWorks Reseller, call 1-800-STORWORK.

an investment in applications and systems that stays protected over time. So call the number below and witness Version 7 in action. At which point, we'll promptly bury the competition. Call 1-800-989-3773 extension 165 to qualify for a specially-priced Version 7 test drive.

These days, everybody and their brother is offering client/server development software with GUI capabilities. GUI, that is, and not much else. Now, introducing **PROGRESS® Version 7**. The client/server development software with an unprecedented mix of graphical capability and depth. And the only GUI development tools powerful enough to take you from pilot projects to even the toughest mission-critical, client/server applications.

Version 7 also lets you create GUI or character-based applications for client/server, host-terminal or mixed configurations. And the applications are portable across a wide range of databases, network environments, operating systems and hardware platforms. Plus, your applications are scalable, portable and reconfigurable without recoding.

The result? Increased flexibility to help simplify the move to client/server. And,

# Business objects think Small(talk)

By Melinda-Carol Ballou

Essex Corp. will begin shipping a tool next month that makes it easier to create object-oriented applications that incorporate business rules and data.

Synchrony is a design and analysis tool based on the Smalltalk programming language that lets developers build and manage objects that represent a business. Synchrony is integrated with Essex's Eafin development tool. This allows programmers to take their Synchrony business objects and generate source code using Eafin.

Synchrony's Smalltalk code-generation features make it different from other object-oriented design and analysis tools, which have fairly strong diagramming and modeling functionality but require developers to manually build classes, said Mike Young, senior systems engineer at Charles Schwab & Co., an investment firm based in San Francisco.

## A good match

Smalltalk is a popular language for object-oriented development because of its built-in support for object features like inheritance and encapsulation. "[Synchrony] diagrams can be brought directly into the Eufin environment so you can start using those immediately," Young said. "If you change the source code, the drawing can be updated from that so you can also reverse-engineer [code]."

He added that it would be "very easy" to diagram business relationships by taking business services and attributes, dropping them on classes and pointing and clicking to set up relationships between business objects. For instance, a programmer building a customer account in a bank-oriented transaction might build a customer class and link that account with the customer's stock-oriented transactions via balance fields using the business objects, Young said.

The existence of those objects lets developers reuse those modules of code whenever they create an application that requires those business functions, which saves considerable time, Young said.

According to industry analysts, tools

like Synchrony will make Smalltalk viable to a much larger segment of the market. This is significant because there are drawbacks to using hybrid object-oriented languages such as C++, they said.

"With Smalltalk, programmers must adhere to object-oriented programming techniques, but with C++ they are merely free to do so and often don't," said Tim

Harmon, an analyst at Meta Group, Inc., a consulting firm with offices in San Francisco. "C++ is a lot harder to learn than Smalltalk, which slows the adoption of object-oriented techniques."

Only 2% of development is currently done using Smalltalk, but that may change as IBM pushes its Distributed System Object Management (DSOM)

technology. Smalltalk will plug in more readily to DSOM, Harmon said.

PurePlace Systems, Inc., Hewlett-Packard Co. and Digital, Inc. are currently pushing Smalltalk tools, and IBM will ship its own Smalltalk-based Visual AGE tools this spring.

Synchrony will ship on OS/2 next month for \$6,995, on Windows in April for \$4,995 and on Unix later in the year. Unix pricing will be announced when that version ships.

## For NetWare administrators who'd rather be using their heads than their hands.

Don't sweat it... script it. Put it another way. If you use REXXWARE\*, you won't have to lose sleep doing routine maintenance in the middle of the night. You can snooze on through while your REXXWARE scripts are doing those tedious tasks — and doing them right.

It's like "virtual fingers." Think about the most tedious (yet important) network management tasks you have. Now imagine writing simple scripts to take care of them all. You can with REXXWARE. It gets the job done while

leaving you free to concentrate on more interesting matters. • Write REXXWARE scripts to Schedule and control any task • Probe disk usage • Manipulate NetWare queues • Compare group volume statistics • And much more. • REXXWARE also lets you perform bindery dumps, broadcast messages, load/unload NLMs — all automatically.

Windows-based scheduler lets you rest easy. No one likes to be a slave to routine maintenance chores that have to be done after hours. REXXWARE frees you up by letting you schedule all those boring, tedious — but necessary —

jobs to run unattended anytime you specify. Imagine never having to go in on the weekend to do network backups and server utilization reports. That's the REXXWARE difference.

Examples to get you started right — and right away:

REXXWARE includes more than thirty hard-working sample scripts. Use them as they are, or customize them as you see fit. Either way, they make REXXWARE your working partner right out of the box, with little or no training.

If you prefer mental to manual labor... Call

Simware today. We're the ones who brought you new levels of PC-to-mainframe connectivity with A2B. And we have a lot more surprises in store. So ask for the free REXXWARE demo disk. It's the smart move, so why not make it today!

Call or fax now! For a free REXXWARE demo disk, or to order REXXWARE, fax your business card to (613) 727-3533 or call 1-800-463-3205 ext. 222

## In Synch

Synchrony includes the following:

- Object Browser to edit and delete new classes and their attributes, services and relationships with other classes.
- Object Diagrammer to graphically represent the classes.
- Attribute Editor to modify class attributes.
- Service Editor to modify class services.
- Event-driven Methods Generator to automate the generation of event-driven Smalltalk methods to let developers visually program the behavior of business objects.

# Corporate America at the Crossroads

## UniForum OPEN SYSTEMS

PROPRIETARY

### Making The Right IT Decisions For The '90s

The evolution to open systems is no longer a question of "why." It's a matter of when and how. That's why attending UniForum '94 in San Francisco will keep you in the driver's seat when key decisions on corporate IT strategies must be made.

Five days of exciting, informative conference sessions and product demonstrations—at the largest conference and exhibition of its kind—will bring you up to date on UNIX and open systems technologies, strategies, and products. It's information that will enhance your corporation's performance. And your career.

### Networking. Interoperability. Connectivity. And More.

At UniForum, you'll hear about the latest developments in open systems. Distributed Computing, Client/Server technologies, UNIX, "Open Proprietary" systems, Windows NT, Networking, Interoperability, Connectivity, Downsizing, and more. You'll also benefit from the real-life experiences of speakers whose successes will illustrate how you can create cost-effective open systems environments right for you. Plus, you'll see over 400 companies demonstrating thousands of products and services to increase your company's productivity.

### Meet Us In San Francisco.

Join tens of thousands of your fellow open systems professionals, from over 50 countries, at San Francisco's Moscone Center, Conference March 21-25, Exhibition March 23-25 1994.

Call (800) 225-6998 (U.S.) or (508) 879-6700 for information on attending or exhibiting, or fill in the coupon below and fax to (508) 872-8237.

Or mail to: UniForum '94, IDG World Expo, P.O. Box 9107, Framingham, MA 01701-9107

UniForum '94. It's the open systems conference and exhibition that helps you keep your options open.

## Procurement

CONTINUED FROM PAGE 1

it buys things—from computers to toilet seats to space telescopes. IS technology—because of its complexity and its rapidly changing nature—has proved especially troublesome for Uncle Sam, whether buying a handful of PCs or multimillion dollar custom systems.

"What we buy costs too much, [the process] takes too long, and we don't even get access to some of the best technology because many companies refuse to do business with us," said Roger W. Johnson, administrator at the U.S. General Services Administration (GSA), which is chartered by law to oversee the government's IS purchases.

Faced with procurement lead times frequently measured in years, users are often saddled with technology a generation or two out of date. Johnson said: "A CEO of a large technology company said to me, 'Roger, I hope when you go [to the GSA] you don't change the rules, or I'll lose my only market for excess and obsolete inventory.'"

The system also takes its toll on managers at user organizations, according to Roger Cooper, deputy assistant attorney general for information resources management (IRM) at the U.S. Department of Justice. He said he spends 25% of his time on IS procurement, time he should spend on managing IS operations. "If you are trying to do big systems in the government and you are not a procurement expert, you will almost inevitably fail," Cooper said.

Cooper and other IS managers said that struggles with the procurement machinery—no surprises about tripping up on this or that regulation—consume time that would be better spent on accomplishing the agency's mission.

**Procurement procedure OK**

Despite these and other criticisms, not all observers agreed that federal IS procurement practices need a top-to-bottom overhaul. "I don't think the system is as broke as people make it out to be," Dornan said. "I don't see radical change as either possible or necessary."

For example, Dornan pointed to the controversial bid-protest process and to a popular perception that every major federal buy gets mired in wrangling among the parties. He said that out of 10,000 so information technology procurements that were subject to protest in 1992, just 123 resulted in protests that had to be settled by judicial process, and 78% of those were decided in the government's favor.

The number may be small, but it is the largest and most visible deals that get mired in controversy, observers said.

While opinions differ as to where the system is faltering, numerous factions are hell-bent on fixing it. Thanks in large part to Vice President Al Gore's "reinvigorating government" crusade, which devotes considerable attention to the topic, procurement reform is all the rage here.

Examples of this include the following:

- Several procurement-reform bills are pending in Congress. One would raise the threshold for streamlined small purchases from \$25,000 to \$100,000, reform the bid-protest process and simplify in various ways the interaction between buyers and sellers.

- The Office of Management and Budget recently announced that it will start requiring contracting officials to explicitly consider a vendor's performance on earlier government work before granting new contracts. It also is developing guidelines to permit greater dialogue between buyers and sellers during the procurement cycle, and it plans to curtail the use of vendor audits by the government and requirements for vendors to provide internal cost data.

- The GSA is pursuing a number of initiatives, from a fundamental overhaul of procurement philosophy to electronic commerce. On April 1, a bulletin board system will begin listing prices of 150,000 PC products from 437 vendors. The aim is to increase competition and reduce administrative burdens on buyers and sellers.

According to Joe M. Thompson, the GSA commissioner for IRM, electronic shopping will lead to reduced prices by allowing more vendors to participate in the process and by helping to maintain a competitive edge by enabling vendors to lower their prices easily and more quickly.

Without such a system, in a recent 15-month period the government bought 17,000 copies of WordPerfect 6.1 at \$392 per copy. Meanwhile, according to the U.S. General Accounting Office, it was available to the public at discount outlets for \$244 and to the state of Texas for just \$223.

Terry Miller, president of Government Sales Consultants, Inc. in Great Falls, Va., said many of the reform initiatives miss the mark. He said most procurement status are not due to inherent flaws in the system but to errors by officials who are poorly trained in IS procurement. "Most agencies don't understand you can't use the same guy to buy kerosene and LANs," he said. "We don't need a new piano, we need a better trained pianist."

"Let's not mess with the rules anymore," agreed David Borland, director of the U.S. Army's Information Systems Selection and Acquisition Agency. "We're all just now beginning to understand them. If we keep on changing them, we'll be constantly trying to learn them while we do business."

Nevertheless, the consensus in Washington seems to be that reform should focus on the rules. "We have had procurement systems and good people," Thompson said.

**Asking questions**

Performance-based procurement is a theme that knits together many of the current reform efforts. It is based on a philosophy that federal IS users and the public will generally be better served by a procurement framework that focuses on results, rather than adherence to regulation minutiae. The GSA is moving to embed that concept in its delegation of IS procurement authority to other agencies.

When an agency comes to the GSA seeking that delegation it is usually handed the money—no questions asked, Johnson said. "We should—and what be—asking. Are you going to be able to protect claims with fewer people? Will you improve customer service? What are the results? We haven't been delegating, we've been abdicating."

Federal IS officials would like to apply that principle within their agencies, but they concede that measuring performance is not as easy as filling out a procurement checklist.

"We're trying to work the problem right now," said Jesse L. Sullivan, director of IRM at the U.S. Department of the Treasury. "We want to delegatize [procurement authority] and empower our bureaus more where their performance has proved itself. How can we set up measures to do that? How do you define performance? It's a hard problem, but we have to do it."

**Army's David Borland:**  
"Let's not mess with the rules anymore. We're just beginning to understand them."

**Results on results:** rather than adherence to regulation minutiae.

## The Army marches to a different beat

The Army has a reputation for running a top-notch procurement system in its 120-person Information Systems Selection and Acquisition Agency, which now manages \$1 billion in IS contracts. Much of the credit goes to its director, David Borland, said Terry Miller, president of Government Sales Consultants.

"It's the best buyer of [IS] today," Miller said.

Borland shrugged off the compliment and said he has no silver bullet, just management stability and old-fashioned leadership. He has been at the agency 18 years and his eight deputies combined have some 100 years of tenure there, he noted.

"We have knowledge of the market," Borland said. "We know the players and they know us. We never surprise anyone. It's like we're at a dance and everyone knows the steps." He visits key executives at vendor companies constantly, he said, and he rarely gets a formal protest over a contract.

**Not all of the credit**

Miller said there are other explanations for the agency's reputation for having satisfied users and nonlitigious vendors. He said it is one of just 15 procurement shops—out of some 2,000 in the government—that buys only information technology.

It is also one of the few that combines contracting, legal and technical people under the control of one person. Miller said he recently saw a request for proposals from another agency that was put together by user representatives in Alabama, buying specialists in Tennessee and lawyers in the Pentagon. "That's a recipe for disaster," he said.

—Gary H. Anthes

## IS purchasing challenges government

In a recent Information Technology Association of America survey of 24 senior government IRM officials, 65% said they thought the demand for IS procurement reform had improved. Only 25% said no; 10% said maybe. To understand the challenge of federal procurement, it is helpful to look at some of the following numbers:

- The federal government buys \$200 billion worth of goods and services annually, using 142,000 procurement officials armed with 4,500 pages of regulations in 2,500 procurement jobs. It spends \$25 billion on information technology—an amount that is growing steadily by \$1 billion a year.
- Source: *National Performance Review; Federal Sources, Inc.; Government Sales Consultants, Inc.*

► "A vice president at DEC told me a few years ago

that if we just took the boilerplate—200 pages of requirements for things like mail and disadvantaged business plans and 'Buy-American' plans—out of our terms and conditions, he would cut all of his bids by 10%," said Roger Cooper, deputy assistant attorney general for IRM at the U.S. Department of Justice.

- In the first nine months of fiscal 1993, vendors returned \$1.4 billion in payments received from the Pentagon, saying they had not submitted bids and were not owed the money. Source: Sen. John Glenn (D-Ohio), Jan. 27, 1994.

- A Defense Department Acquisition Streamlining Panel recently completed a congressionally mandated perusal of Pentagon procurement practices. Its recommendations filled 1,500 pages.

# Computer Industry

## Briefs

### HP results rocket

Citing strong demand across its computer product line, Hewlett-Packard Co. last week posted first-quarter net earnings of \$208 million, a 41% increase from the same period last year. Revenue in the period ended Jan. 31 grew 24% to \$5.6 billion, the Palo Alto, Calif., vendor said. HP said orders in its computer business grew 22% in the period, led by printers, PCs, workstations and network and systems management products.

### Microsoft takes over

Microsoft Corp. has agreed to acquire Softimage, Inc., a Montreal developer of two- and three-dimensional computer animation and visualization software in a stock deal valued at \$130 million. Softimage's products are used by film studios and animation houses in post-production units, along of visual images, text, sound and special effects.

### Acquisitions up

Merger and acquisition activity in the information technology field jumped 36% in 1993, totaling 713 transactions, according to Broadview Associates, a Port Lee, N.J., investment banking firm. Value of the deals was estimated at \$29 billion, a 34% increase from 1992.

**SHORT TAKES** Legend Corp. has invested about \$2 million in Software Clearing House, Inc., a privately-held Cincinnati-based developer of distributed network systems in management software.

**ADMIN CORP.** has agreed to acquire Compustation, Inc., a State College, Pa., supplier of network-based print and image management systems. Terms were not disclosed. **WEST** Communications Systems, Inc. in the 29 states outside of BellSouth's region.

## ASK CEO's exit has users wary

By Kim S. Nash

The unexpected resignation of The ASK Group, Inc.'s chief executive officer has left ASK users and analysts wondering what else can happen to a firm already weighed down by multimillion-dollar losses, layoffs and slipping market share in several key product areas.

After CEO Pier Carlo Falotti cited "personal reasons" for his abrupt resignation two weeks ago, Santa Clara, Calif.-based ASK quickly contacted user group leaders. The message: Don't panic. Marketing and development plans created by Falotti during his 17-month reign will be carried out, said Chief Financial Officer and acting CEO Les Wright.

### Looking for change

"I'm still waiting to see the result" of ASK's year-old corporate reorganization, said Michael Campbell, president of the ASK User Society (ASKUS), a 500-member group of ASK applications users. He said he has not seen any changes—positive or negative—so far.

Falotti's departure throws another wrench across ASK, which reported losses for five of the last eight quarters (see chart). The firm comprises three companies: Ingres (database and tools), Data 3 (applications) and ASK (manufacturing applications).

### Large losses

After \$20.5 million in losses so far this fiscal year, ASK could have a better third quarter. Smart Canada Ltd. and Openheimer & Co. recently signed large contracts for the Ingres database, according to a source briefed by ASK. The deals were only two of a few pending agreements that did not come through in time to make fiscal second-quarter losses, contributing to a \$13.7 million quarterly loss.

act, too. "I'm not going to put the failure of my company on the assumption that ASK will be around tomorrow," Couron said.

### Praise and censure

Some of DC Systems' problems highlight the fact that historically, ASK has been praised for the fine technology but rebuked for weak marketing. The characterization still applies, observers said, but some users noted that Falotti had upped ASK's visibility.

For example, ASK has tripled its sales force and stressed the need to "make the customer happy." Falotti also streamlined business units and added technical support workers. As a result, some users are guardedly hopeful that ASK will overcome. "This is a hump in the road, not a disaster," said Kitty Weaver, president of the North

American Ingres User Association (NAIIA). She said the 850-member user group is generally optimistic about ASK's prospects.

Information systems shops "should look at the product, not at the CEO," said Weaver, who is also a systems administrator at the National Center for Atmospheric Research in Boulder, Colo. She said her company is impressed with ASK's 4GL for Windows, a graphical development tool that doubles as the first piece of the firm's OpenRoad strategy. OpenRoad is ASK's plan to build tools that can be used to create applications for rival databases.

ASK taps competitors in some ways but lags in others. In December, ASK was first among the Big Four database makers to ship a replication product. However, the company did not release a NetWare version of Ingres until this month, while Sybase and Oracle have been shipping databases for Novell, Inc.'s operating system for more than a year.

One potential saving grace for the firm as a whole is that most of its license revenue comes from sales of relational databases, said Curt Monash, president of Monash Information Services, a New York consulting firm.

"Ingres will continue to generate money for ASK, but the question is whether that's enough to sustain the company, especially if new license revenue is not growing," he said.

Pier Carlo Falotti's resignation as ASK's CEO comes at an unfortunate time.

## Falotti ASKed user groups to unite

Much as he tried to streamline ASK itself before resigning, former CEO Pier Carlo Falotti was pushing the firm's three major user groups to unite.

While users of ASK and Data 3 applications and the Ingres database said they are considering unification, they have not jumped at the idea. ASK "anticipates this realization, but they have to live in a world where different products are sold to different individual groups are going in," said Kitty Weaver, president of NAIIA.

A single group is not being because a consensus user value might have more impact on ASK's decisions, said Michael Campbell, president of ASKUS. However, the group will not become one if a majority of their members do not want to, Weaver and Campbell said. Meanwhile, communication among the groups has improved, with members scheduled to attend one another's meetings this year and next.

Money is one driving force behind ASK's desire to unite the groups. The company would no longer have to send executives and engineers to multiple annual conferences. Plus, allocating time and resources to a single large meeting each year would be easier than orchestrating separate events.

While the groups weigh unification, financial independence from ASK is first and foremost on the minds of the presidents of the two largest organizations. For example, ASK currently pays NAIIA \$40 for each person who goes to the group's annual conference.

## SCSI ARRAY.

Imagine, a fourth of your data just vanished with absolutely no hope of retrieving it. Nice thought, eh?

Well, that's pretty much unimaginable since our

new PowerEdge™ servers\* have an optional Dell® SCSI Array. You can set RAID levels

for the performance, redundancy and protection you need. And configure hot spare drives that automatically rebuild your data if another drive fails. And hot plug drives allow you to replace a failed disk without turning off the system. It's like fixing a flat tire while you're driving.

What's more, as your company grows, so will your Dell server. Because we offer the latest Pentium™ processor-based designs, including lightning-fast 60 and 66MHz systems.

Our 486 servers can be upgraded to use a fully optimized Pentium processor

## NOT A RAY OF HOPE.

board. What's more, with at least seven expansion slots, RAM to 128MB, and disk space up to 114GB by using our external media systems, our new servers can more than keep up with any growing network.

Need proof?

We'll send you a few case histories showing how others have benefited from Dell's servers.

We'll also include our Advanced Solutions Capabilities Guide which will fully describes Dell's complete network offerings.

Call now to talk with a sales representative or for a referral to one of our many network resellers. Meanwhile, keep your fingers crossed.

# IBM wrote the book on business computing. Now we've written the catalogs, too.

It's IBM Direct from IBM  
—four easy-to-use catalogs that  
give you direct access to a vast  
array of IBM products and

services that can help you run  
your business more efficiently.

Whether you reach us by phone,  
fax or mail, IBM Direct is the  
most convenient way ever to get  
answers to questions before you  
buy, place orders and take advantage  
of special promotions.

Everything from compilers  
to complete CPU upgrades in  
four user-friendly catalogs.  
Nothing's more compatible  
with your IBM system than  
IBM products and services. And  
ordering them has never been  
more convenient.

Simply call 1 800 IBM-CALL  
to order any of our free IBM  
Direct catalogs—*The IBM RISC*

## I want a Direct line to the IBM product line.

*System/6000® Direct Catalog, The IBM AS/400® Direct Catalog, The IBM Networking Direct Catalog or The IBM Mainframe Software Direct Catalog.* In these catalogs, you'll find a wide variety

of hardware and software to fit any IBM midrange system, the latest in PC networking products and a complete selection of IBM mainframe software.

**Direct answers, expert advice.**

When you dial 1 800 IBM-CALL you'll have instant access to specially trained IBM Direct staff members who are experts on your particular platform.

The IBM Direct staff is prepared to answer questions and process your orders quickly and efficiently. When necessary, they'll prepare configurations based on your existing IBM installation and fax their recommendations to you—so you can make well-informed decisions. Plus, they'll also ensure that your local IBM representative or team is available for assistance with installation and support.

**IBM quality backed by the IBM guarantee.**

When you buy from IBM Direct, you get the full IBM commitment to quality and customer satisfaction. The same top-quality hardware products

backed by the same reassuring IBM guarantee. And, of course, the same exclusive warranties to protect your software purchases.

Choosing IBM has always been an easy call. Now buying IBM products is easy, too. To place an order or request your free IBM Direct catalogs, simply dial 1 800 IBM-CALL (1 800 426-2255), Dept. 100A, weekdays between 8 a.m. and 8 p.m. Eastern Time, or complete and return the attached business reply card.

## Howdy, partner

The vendors want to be your partner. They have a vision whereby together you'll navigate the turbulent waters of client/server technology, with them serving as pilot to steer you away from shoals and reefs.

The manifold expression of this desire to partner is the vendors' consulting units. They range in size from basement operations to full-blown divisions. Most vendors proudly point to the profitability of their consulting divisions.

The consulting sales pitch usually sounds like this: "Our job is to serve our partners with the best available solutions. And if that means selling you a database other than the one we make, that's just fine because that's what friends are for."

Microsoft, however, seems to have taken a different tack. Its consulting effort is similar in that a) it is big — approaching 500 people, with plans to grow to 2,000 in a couple of years; b) it wants to be your friend and partner; and c) it is at the vanguard of the company's drive to capture the hearts and minds of corporate IS.

That's where the similarities end. The consulting division has fiscal responsibility only to cover its costs, like a nonprofit group. That's the way Microsoft will keep it for the foreseeable future.

More important, the division has little if any interest in selling you anything other than Microsoft products, only it'll tell you this right up front. As division chief Bob McDowell puts it, "My card and the card of every one of our employees says 'Microsoft' on it. We seek to enhance our customers' environment with Microsoft solutions."

I don't know if that is refreshing or naive or honest or arrogant or what. Probably a bit of each. But it is certainly a different approach.

To be sure, what Microsoft needs is a different approach for addressing IS. There is plenty of evidence, anecdotal and otherwise, that an agnostic Microsoft is not viewed as a company that gives much of a hoot about corporate IS' internal operations and, therefore, its challenges. Microsoft is often seen as lacking patience with IS, with not understanding that the IS sales cycle is very different than selling shrink-wrapped software at superstores.

Microsoft seems befuddled and frustrated that IS is taking so long to evaluate Windows NT, let alone mark it as a server standard.

To his credit, McDowell, a former IS director, seems to understand these issues. And he swears that Microsoft is "besting part of the farm" on NT.

That's the kind of message that his boss, Bill Gates, needs to get behind in a more convincing way. The slow roll of NT and pronounced acrimony from Microsoft headquarters that in the future, the majority of the company's income will be derived from the consumer market has many people wondering just what kind of enterprise commitment the company has.

*Bill Laberis*

## Stocking health care warehouses

Hospitals have three ways to tie together data from different departments ("Drug data fails to connect," CW, Jan. 17). Replace the existing systems with an integrated hospital information system, connect the stand-alone systems in one another, or download data into a central data repository.

The first solution is expensive and time-consuming, the second complicated and difficult to maintain. Only the third option — creating a data warehouse — is quick, affordable and straightforward. Several firms provide such repositories along with the software to access and analyze stored data.

This is just another example of how information technology can play a pivotal role in health care reform.

Warren S. Demarjian  
John G. Nappoli  
SMI, Inc.  
Port Jefferson, N.Y.

## Saying 'no' isn't always so easy

"Just say NO to documentation" (CW, Jan. 17)? OK, if only it were that simple! If I had a nickel for each time I've found myself in some quagmire in which a simple note left here or there would have helped me find my way back to solid ground, I'd be reading my *Comptons* from your yacht some-where near Tahiti.

Just because programmers don't like writing documentation doesn't mean it isn't useful to end

users and other folks. Regarding shelf life, it's a part of the job to update the documentation when you change something, even though you might not like doing it. It's too bad programmers have a part of the job they don't like, but hey, welcome to adult life.

And as for implying that even documentation for training purposes is a waste of time, we all know what happens when users are not trained properly — the best design for a system is rendered garbage in a short time.

Nanette Rubin  
Albany, N.Y.

## Systems offer the spice of life

I certainly didn't get your ORZ Shell Game cartoon (CW, Jan. 24). You have sunk to the depths of name-calling in your attempt to scuttling OS/2.

Every major operating system has several flavors. You can get NetWare in 3.x, 3.5 and 4.x versions; you can get Windows in 3.1, NT, Windows for Workgroups and Cairo (soon); and IBM's mainframe operating systems are available in a dizzying array of varieties.

Your magazine has too many good news articles to be blemished by editorial content such as this nonsense.

Bruce Drembick  
Houston, TX  
Stan Jones, CIO/CI

## The Postal Service: A growing burden

Bill Laberis' "Post Mortem" (CW, Jan. 24) raises some very valid concerns regarding the U.S. Postal Service. I would like to point out an issue he missed — namely, that the government itself is one of the post office's largest customers.

Aside from the regularly scheduled mailings of hundreds of millions of IRS forms, Social Security checks, federal and military pension and payroll checks and government publications, all of which move at the expense of the taxpayers, consider the bumble frunking privileges enjoyed by our elected officials and their minions.

Quite apart from the recent revelations of creative financing developed using the post office by such luminaries as U.S. Rep. Dan Rostenkowski, these folks have the unlimited right to fill our mail boxes with all manner of propaganda without paying a dime.

Geoffrey H. Wacher  
Frog, Mich.

## Getting to know you

**Ellis Booker**

**T**he heady hype over the coming information highway has pressed the privacy alarm—again.

**I** Consumer and citizens' rights groups have declared that whatever its structure, the future information highway must protect the sanctity of our privacy, our anonymity.

(Not that any of this is new. "As long as you didn't get on a list, nobody knew you were here," my paternal grandfather used to say. He immigrated to the U.S. in 1910, long before American Express installed its first computer on the Internet received its first data call.)

This well-meaning concern over privacy is silly.

First, I guarantee there will be hundreds if not thousands of "anonymous" services — including, yes, adult text chats and adult videoconferences. There is already a huge market for such private transactions.

But I'm equally convinced that the innovations on the information highway, the things that will change the economy and society, will depend on smart systems, ones that know us, our individual tastes and preferences.

Take movies on demand. Sure, it's convenient to order a movie from the PG/TV in one's living room and eliminate a car ride to the video store. But I suspect my business will ultimately go to the video-on-demand company

with a database that is aware I'm an Orson Welles fan and that will alert me each time a new multimedia documentary on Welles becomes available.

The information highway will have to know us, help us. Otherwise, how can we possibly hope to filter through the torrents of information, news and research that it will make available to us?

But can "being known" backfire? Of course.

Robert Ellis Smith, publisher of the "Privacy Journal" in Providence, R.I., points one particularly ugly example: A

woman buys diapers and then has a miscarriage. Months later, via her interactive terminal, she starts receiving commercials showing bouncing babies. "Can you imagine the Orwellian, kafkaesque messages?" he asks.

Yes, horrible. But it already happens today. It's called direct mail. And the fact is, this error will be fixed much faster when the woman can send a shotoff message through an electronic network.

I'm also confident that through legislation

(or plain old acumen on the part of information highway businesses) consumers will be able to determine how far their personal information is allowed to propagate. Many marketers already operate under the voluntary code of fair information practices, which states that personal information collected for one purpose

should not be sold or used for another without the individual's consent.

Harris Gordon, a partner at the Boston office of Deloitte & Touche sums up the middle ground when

highway  
e 811th.

send me, I'm happy to exchange some information about myself."

Moreover, Gordon says, the millions of us who shop via phone and catalogs often crave the kind of personal recognition our grandparents enjoyed at the corner store. "If I'm a good client, I want to be treated well," he says.

Put another way, getting on a list is fine with me, so long as I get what I want.

## Closing the gap to save your business

Patricia B. Seybold

**T**here's a huge gap between business re-engineering and information technology. Yet for most companies to survive, that gap must be closed.

**I** . One of the most often cited failures of business re-engineering is AT&T's first attempt to re-engineer its 800-number service. The re-engineering team pro-

proposed a solution to radically reduce the time required to activate a

**Business process**

they access the interlinked applications needed to process service orders, get installation crews on-site and set up maintenance and billing procedures.

The go-tocha was the daunting task of linking geographically dispersed legacy systems to deliver streamlined, integrated applications to the desktops of customer service personnel. All of us suffer from the same difficulties with large entrenched systems that were purpose-designed, have served that purpose and now need major revamping.

The problem isn't our legacy systems. It's the fact that our business logic is locked up in

those applications and systems.

How should you design applications to support re-engineered business processes? First, you need to capture your business logic and the definition of your business information objects in a high-level, easily understood, dynamic form—an electronic model of your business from which you can generate applications.

Object-oriented modeling techniques lend themselves well to

Once you've unlocked the business logic

from your applications, you need to create a model of the business as the businesspeople think of it. This is where your business information objects come in. This domain model of your business changes dynamically as your executives, customers and employees create meaningful new distinctions about what kinds of information are relevant for optimal perfor-

mance. This model is owned by the businesspeople, not the programmers. And you may discover that much of that information can remain encapsulated in its legacy stronghold.

The next step is to link these business process and business objects design and modeling tools to your rapid application development activities. This is where the big gap still exists.

We can do rapid application prototyping and development using client/server tools or we can use integrated CASE technologies to do a more thorough, top-down job of designing and developing processes and applications.

Take the new business objects and rules you create with rapid application development, client/server applications and feed them back into your dynamic business model. The top-down approach is more rigorous but too slow for a rapidly changing business climate. Bottom-up applications are often too sloppy and not optimized for performance and integrity.

Business process and business object modeling should be at the core of all our application development efforts, top-down and bottom-up. That's how to close the gap between re-engineering your business and application development, and it's the only way you'll be able to continually re-engineer your business.

Seybold is president of Patricia Seybold Group in Boston. Her Notes address is [Patricia.Seybold@PSBG](mailto:Patricia.Seybold@PSBG). Her Internet address is [PSeybold@McImail.com](mailto:PSeybold@McImail.com).

## PCs key to growth of imaging

By Michael Vizard

**F**or most information systems organizations, imaging has been one of those tantalizing technologies that has promised much but never quite lived up to its potential. Instead, the adoption of imaging has been happening incrementally as companies try to eliminate as much paper as possible.

"It used to be you'd see companies buying imaging systems for a department with 30 to 40 people in it," said Scott McCready, an industry analyst at International Data Corp. in Framingham, Mass. "Now we're seeing sales involving 4,000 to 5,000, even 9,000 units at a time."

The primary reason imaging has been slow to deliver is that most of the imaging systems in wide-scale use today are expensive systems that use proprietary back-end servers accessed by Windows or OS/2 clients.

But as imaging technology becomes better integrated with existing desktop applications, users can expect to see a finality of sorts in a variety of mainstream applications during the next two years. In fact, the capabilities of stand-alone desktop imaging packages for Windows and OS/2 from companies such as Core Corp., Watermark Software, Inc. and Xerox Corp. have improved dramatically during the past year.

### Challenge of integration

But the challenge facing IS will be integrating these packages with the mainstream applications running on Windows and OS/2.

"It's inevitable that vendors, whether it's part of their operating systems or applications, will include support for imaging as a data type. Application providers will then provide value on top of those basic imaging functions," McCready said.

"There is this animal called the electronic document, but all the pieces aren't in place yet," said Carl Frappozoli, executive vice president of the Delphi Consulting Group in Boston. "Because of this, imaging as a stand-alone market is dying. Imaging is really just another data type, not a separate application."

Already all the major PC applications vendors, including Microsoft Corp., Novell, Inc., WordPerfect Corp. and Lotus Development Corp., are working on integrating imaging as a core component of their future compound document architectures.

"People don't want to have to treat imaging files as a separate thing apart from their other files," noted Mary Bandford, an industry analyst at BIS Strategic Decisions in Norwell, Mass.

Once the major vendors deliver imaging as a standard part of their document management wars over the next two years, Bandford noted that imaging will have crossed over from being a function to a specific feature of most applications.

But before imaging on the desktop graduates from being a convenience to a ubiquity, a number of enabling technologies have to fall into place. Two of those technologies, compression and optical character recognition (OCR), already have. However, technologies such as workflow, compound documents, text retrieval and robust client/server architectures are still in the early stages of development.

"One of the impediments for imaging is that the technology infrastructure is unsuitable. And it's un-

realistic to think that one application is going to justify the necessary upgrades," McCready said.

Nevertheless, technology advances are making imaging more attractive to the average user. For example, compression technology has become more widely accepted following Microsoft's move to include a disk compression utility in DOS. This means that users will not have to dedicate gigabytes of disk space to support imaging applications.

### OCR gets better

Meanwhile, the capability of scanners using OCR has improved dramatically over the past 18 months thanks to the incorporation of neural network algorithms. These algorithms enhance OCR offerings because they can also be used to enhance images, format scanned documents and provide the underlying structure for editing documents once they are scanned.

Angel Padilla, a member of the research and development team at Allergene, Inc., a pharmaceutical firm based in Irvine, Calif., is using Page-Keeper from Core to attach articles taken from medical journals to memos and other documents.

"Page-Keeper lets me call up articles from journals stored on a database fairly fast without the pain of having to look them up in a file cabinet," Padilla said. "I can then cut pieces of those images and attach them to memos and reports."

These compound documents typically consist of imaging files attached to simple word processing files. But as object technologies become more prevalent, users can expect to see more compound documents as object-oriented infrastructures, such as Microsoft's Object Linking and Embedding (OLE) 2.0 interfaces or the OpenDoc specification created by IBM and Apple Computer, Inc.

In fact, the advent of low-cost OLE 2.0 imaging products from vendors such as Core and Watermark Software, combined with distributed services such as Lotus' Notes, will make imaging a mainstream application in the very near term.

With OLE 2.0, I think you'll see imaging's widespread use in office automation, and it'll happen pretty quickly," said Frank Gibbons, president of Publishing Technology Management, Inc. in Arlington, Mass.

### Imaging by the numbers

#### TYPICAL COST BY CATEGORY OF AN IMAGING SYSTEM

The complexity of imaging systems results in large services costs related to implementation and customization

Hardware	15%
Software	21%
Services	64%

#### IMAGING PLATFORMS (ACTUAL OR PLANNED) (dependent base: 370 IS managers)

As the move toward PC-based graphics applications evolves, the share of the imaging market held by PCs should increase

Unix 27% Mainframes 16%  
Minicomputers 27% PCs 30%

#### PRODUCTS BY PLATFORM

IBM PCs and Unix systems have become the dominant platforms for hosting imaging applications, according to an analysis of vendor product offerings

Source: Delphi Consulting Group, Boston

## Different approaches

For many IS professionals, the concepts being applied to client/server computing are essentially attempts to reinvent the functions provided by a mainframe across a distributed PC environment.

"The big difference is that when many PC people approach client/server, they don't realize all the things they don't know," said Jonathan Handler, senior consultant for operational technology assessment at Blue Cross and Blue Shield Association in Chicago. For example, PC enthusiasts are beginning to understand the value of preemptive, multitasking, multi-threading systems running on the client. These operating systems, such as OS/2, Unix and Microsoft's Windows NT, let applications perform multiple tasks while handling memory contention issues,

frequently the base of client/server computing.

And since OS/2 provides these capabilities with less system resources than either Windows NT or Unix, many organizations rely on OS/2 as their client system. This is not to say that Windows 3.1 is not widely used in these applications. However, OS/2 typically provides higher levels of performance on the same hardware platform running single-threaded Windows 3.1 applications because OS/2 is a multitasking operating system.

For example, Handler noted that FileNet recommends that the minimum Windows client be a 486DX33-based system configured with 8M bytes of memory. The minimum OS/2 client is a 386SX33 with 8M bytes of memory.

Microsoft, however, should effectively address these issues with Windows 4.0, a 32-bit preemptive multitasking environment due out by year's end.

—Michael Vizard

# Stac gains space with compression tool

By Ed Scannell

Stac Electronics last week delivered a new version of its data compression product that company officials said they believe is the first to break the 2-to-1 compression ratio barrier.

On average, Version 4.0 of Stacker for Windows 4.0 DOS gives users a 29-to-1 compression ratio through a new technology called SmartPack that more "intelligently" packs data on a hard disk.

"SmartPack was designed to eliminate wasted space in and around files in that it does both sector and cluster packing," said Anne Golds, product manager at Stac Electronics. "Users with a 100M-byte drive will get at least 150 additional megabytes of disk storage."

Company officials said they believe growth prospects for data compression remain solid, but the bigger opportunity is shifting toward portables as desktop systems ship with much higher disk drive capacities.

"We have seen a definite trend among corporate accounts toward [data compression] on laptops, especially those not directly tied in to a network," Golds said.

Microsoft Corp.'s bundling of DoubleSpace with its DOS 6.0 has also further encouraged the use of compression technology. As of last August, 62% of the 11 million DOS 6.0 users had used the product, according to company figures.

But although DoubleSpace has certainly raised the visibility of compression technology, some observers stop short of saying it has legitimized it, which some last year predicted might be the case.

"Microsoft has shipped a lot of [DOS] 6.0, but I don't think that many people are using it. That [62% of DOS users using DoubleSpace] figure sounds high," said Walter Miao, vice president of technology research at Link Resources, Inc. in New York.

While the prospects for market growth look good for some vendors this year, such as Microsoft and Stac Electronics, the data compression market may turn out to be a two-horse race.

Adisec, Inc., which has been providing IBM's Personal Software Products group with its Super-Serial compression utility for PC DOS 6.1, closed its doors last month. Personal Software Products officials said they will continue pro-

Making room

With an increasing number of desktop systems shipping with high-capacity hard drives, many users do not see a need for data compression products. But that belief may not last. With the expected onslaught of true multimedia applications with voice, video and imaging capabilities, even users with zork-byte hard drives will be looking for more disk space. "When we get to real multimedia, it will eat up disk space like it is going out of style," said Walter Miao, vice president of technology research at Link Resources.

"This approach has always offered a lot of flexibility. New sections can be created, deleted and customized by users.

But while most ENI files happily reside in growing disorder (for some reason they are never indexed), all of them have to be read through before the program can answer a request. The results are longer access times and lots of waiting around.

Modular programs could solve part of this because even competing programs can share an ENI file, as long as the developers agree on simple naming conventions. But only feeble attempts have surfaced thus far.

WordPerfect might just as well have a "Keep Out" sign posted on its BIFs. Fower users take note: No more tinkering. Swapping INIs for BIFs is like trading up from a Volkswagen Beetle to a Benetton with fuel injection and electronic ignition. And WordPerfect 6.0 is not having a smooth transition.

The new WordPerfect for Windows Version 6.0 crashes whenever I try to access any of those special bells and whistles, such as Chart Editor. The program also crashes whenever I try to print a letter. Perhaps WordPerfect 6.0 is not able to read the fonts and graphics codes in files created with the earlier version.

What's more, after the system has crashed a few times, the file that contains all those WordPerfect user settings (reset.hlp) becomes so corrupted that it

must be reinstalled.

WordPerfect has promised to post a fix by the end of next month on CompuServe. But only a small percentage of users go on-line regularly, so most won't know about it. If it were a General Motors product, it would be recalled. Instead of a radical shift to BIFs, vendors such as WordPerfect should put their software on a diet.

## No more Easter eggs

There's another, more subtle change taking place, also inspired by the sheer size of today's programs. Gone are the "gung screens" to those hidden animated tributes to the development team that once were in almost every Windows package. Software vendors call gung screens "Easter eggs" because finding them is like a treasure hunt. You need a special combination of keystrokes and mouse clicks to locate the eggs.

Software Publishing dropped its screen after updating Superbase. And Symantec's Norton Desktop for Windows 3.0 had its screen yanked at the last minute to save disk space. You'll find the names of the Norton Desktop team listed on the front page of the user guide.

But sadly, the fun is gone.

If you haven't already found the secret screen in Norton Desktop for Windows 2.2, you may want to take a nostalgic peek before you upgrade. Here's how to bring it up:

viding users with the AdStor product.

Stac Electronics has also changed the look of the product by adding the Stacker Windows Toolbar. Commands in the new tool box include alarms for changing disk conditions, ways to more easily manage, diagnose or repair drives and ways to get more detailed reports on which data files and applications are taking up the most space.

Stacker 4.0 can be installed on systems using Microsoft's DoubleSpace. The Stac Electronics product automatically converts compressed data at setup time.

## The changes

Despite the added compression capabilities, the usual associated performance degradation is "negligible" in the new version, Golds said. The company has also reduced the amount of memory the product requires from 47K to 17K bytes, she added.

Stacker 4.0 is compatible with MS-DOS Versions 3.2 through 7.0. Stacker drivers can be preloaded with PC DOS 6.0 and 6.2, as well as with PC DOS 6.1 and Novell, Inc.'s DOS 7.0.

Corporate accounts buying a site license for 100 or more copies will receive network and monitoring capabilities. These allow information systems professionals to more easily transfer Stacker from the network server to individual workstations.

The suggested retail price for Version 4.0 is \$149. Corporate accounts buying a site license for 100 or more copies can upgrade for \$49.95.

Stacker for Windows 4.0 was scheduled to be available through retail outlets last week, company officials said.

Carole Patton

## Gong for the gang show

Software is so bloated that its developers are being forced to adopt more radical architectural changes. WordPerfect is one of the first vendors to scrap traditional architecture and replace it with something completely new. Binary Initialization Files (BIF). And you can soon expect similar moves from Microsoft.

The reason? Today's complex programs have become so feature-inflated that access times are unacceptable.

BIFs get rid of those ever-present initialization files (ini) Windows programs have always used to handle program settings. Called "INI" (rhymes with Minitel) files, initialization files are a simple way of listing—and changing—a program's features because the setting information can be read and updated only by humans (INIs are really just text files).

With the Norton Desktop in the background, go to the help menu and click on "About." Hold down the N, D and W keys, and then double-click on the Symantec icon. The screen pictures team members who reveal favorite quotes, including tidbits such as, "I want you all to stonewall it" (Richard Stone).

Microsoft's Access 1.1 still has a great gung screen. To bring it up, open any Access database (the sample NWIND database will do) and create a new table named "currus." Be sure you type "currus" in lowercase letters. Give this new table one field of any type, with no primary key, and save it as the table.

Next, highlight "currus" in the table container, go to the help menu, and select "About Microsoft Access." Access will open a dialog box that displays the Access logo at the top left corner. (The logo icon is a key and a table.) Position your mouse on the Access logo, hold down the Ctrl and Shift keys, and double-click the right mouse button.

You'll see an animated cartoon in which a pair of ducks ("Parnders") are zapped by lightning bolts, followed by the names of the entire Access development team. Look very closely at the last name in the list of people being thanked.

## Multimedia is growing by leaps and bounds

By Michael Fitzgerald

A raft of multimedia announcements indicates that this loose collection of technologies is beginning to gather steam in the marketplace.

But in the corporate marketplace, analysts say multimedia continues to lag.

"It's still much bigger to the consumer world than the corporate world," said Jeffrey Henning, an analyst at BIS Strategic Decisions in Norwell, Mass. BIS projects that 14% of all PCs in 1994 will ship with a CD-ROM drive.

Still, among the announcements are some actual applications:

• **The Texas Employment Commission** last week unveiled Info/Texas, which will comprise 50 multimedia kiosks spread across the state in malls and other public sites. Info/Texas was designed to let both Spanish and English speakers access job-matching information on-line, with full-motion video and sound. Other state ser-

VICES will eventually be added. Texas is the fourth state to install such multimedia kiosks.

• **Cable News Network** begun using The Network Connection's NewsView, a system designed to let television news editors call up images and edit video clips while preparing news packages. The technology runs at 30 frames/sec. — the same as standard television images — and uses Motion Picture Experts Group compression technology.

• **Acer America Corp.** announced five new multimedia machines in both desktop and tower configurations. A low-level 486 system with a double-speed CD-ROM drive, a 210M-byte hard drive, a sound card and a suite of

software that includes Microsoft Corp.'s Works 3.0 Multimedia Edition will retail for a base price of \$1,999. A tower system will cost at \$3,500.

Advanced Logic Research, Inc. began shipping its Multimedia Express, a desktop PC based on the 25/50-MHz Intel Corp. 80486DX2 processor. A PC with a dual-speed CD-ROM drive, a 16-bit stereo sound card and a monitor has a base price of \$1,505.

Advanced Micro Devices, Inc. (AMD) said it would license Ultrasound, an audio technology by Advanced Gravis Computer Technology Ltd. in Vancouver, British Columbia. AMD will integrate sound into some of its integrated circuits.

• **Motorola, Inc.'s** Microcontroller Technologies Group will release today an updated version of its DSP56000 family of digital signal processors. The new PC Media strategy is a combination hardware/software offering that will run under Windows and will eventually run full-motion video.

In a related development, Roh Lippincott, executive vice president of the Interactive Multimedia Association, said in a round of recent hearings at the U.S. Patent and Trademark Office that it should reconsider the way it grants patents on technologies such as multimedia. The hearings were sparked by an industry outcry over the granting of a broad multimedia patent to Comptco's NewMedia in Carlsbad, Calif. That patent is under review [CW, Nov. 22, 1993].

## Imaging

CONTINUED FROM PAGE 30

"What you're seeing is the bringing of imaging down from the back room to the desktop," said John Migliore, executive vice president and chief operating officer at Caere. "Previously, imaging required a decision by a corporation or an MIS group in that corporation. Now it will be

just part of people's desktop."

However, McCready noted that while some \$99 imaging packages are available, these offerings may not be robust enough to run enterprise-wide applications.

Once imaging becomes an integral element of compound documents, users will need easier ways to find documents on the server. This part of the puzzle is being addressed by indexing and text retrieval technologies bundled into imaging prod-

ucts or purchased separately from vendors such as Verity, Inc. or Fulcrum Technologies, Inc.

Ultimately, text retrieval technology will incorporate agents that allow these tools to make more intelligent searches of document databases. "We're already beginning to see the idea of people creating custom newspapers from on-line news services," McCready noted.

Meanwhile, workflow technologies are becoming one of the most important ele-

ments of document management architectures. Many imaging providers have already developed their own workflow engines or opted to bundle in technology from companies such as Action Technologies, Inc. or Rensh Software Corp.

### Learning by doing

But the full potential of workflow technologies will not be realized until people actually re-engineer their work processes. "Paper is a sequential process. Electronic workflow allows you to introduce parallelism into the process so people can work on different parts of the process at the same time," said Jonathan

Handler, senior consultant for operational technology assessment at Blue Cross and Blue Shield Association in Chicago.

Once this re-engineering takes place, alongside the adoption of more robust client/server architectures, the use of LAN-based imaging products such as offerings from ViewStar Corp. and Keyfile Corp. will increase. And as imaging proliferates, it will likely straddle into three distinct markets: a low-end desktop market, LAN-based offerings and the high-end enterprise-wide solutions offered by companies like IBM and Wang Laboratories, Inc.

### Summer sales

ITS Strategic Decision predicts that 4.5 million scanners will be sold in this year alone, compared with an estimated 3.3 million units for 1991.

### The customer

"Everything is about serving the customer better. If it's not in an imaging system, you're talking about looking it up on microfilm, which could take a day or more," said Jonathan Handler at Blue Cross and Blue Shield Association in Chicago. "But it's impossible to do imaging without incurring a lot of costs. What you have to find is the applications where the benefits outweigh the costs."

## Mac to get fuller NetWare

By Elisabeth Horvitz

■ Users frustrated with Novell, Inc.'s limited support of Macintosh clients on NetWare can take heart: Novell is preparing to provide the Macintosh with a much fuller range of NetWare-based services.

The rollout of improved NetWare services for the Apple Computer, Inc. desktop will begin later this year and continue through 1995, according to Susan Hanson, director of the Provo, Utah, company's Macintosh services group.

Such a move would serve a significant number of companies that have hooked Macintoshes to NetWare. And LAN administrators who have their Macintosh and Windows machines on NetWare said they would like to see more commonality of services and administration across the two types of clients.

Stryker, Tunn & Dill, for example, has 80% Macintoshes and 20% PCs; the Newark, N.J., law firm switched over to NetWare from AppleShare because it needed a network operating system that would support both types of systems equally, said Michael Banker, systems administrator.

Macintoshes and PCs can share files and printers on NetWare 3.12 quite well, but "in a NetWare 4.01 environment, Net-

Ware for Macintosh does not provide direct access to NetWare Directory Service [NDS]," he said.

Novell's current NetWare client software for the Macintosh consists of a NetWare Loadable Module that implements AppleTalk, Apple's e-

native communications protocol for the Macintosh, or Novell's network operating system platform. This enables Macintoshes to access files and printers in the NetWare environment using their native communications protocol, Hanson said.

Furthermore, a gateway translates between the Apple and NetWare file and print share environments. This allows Macintoshes to access the NetWare file and printing resources and, conversely, allows a Windows NetWare client to access an AppleTalk printer.

However, Macintoshes do not run Novell IPX and NetWare Core Protocol (NCP) at this time. This makes the gateway necessary and precludes Macintosh access to NDS. Right now, Macintoshes can only access the bindery-based NetWare 3.11 directory.

"Mac users cannot even use NDS," to browse files or administer the place of Novell's global directory that pertains to their workgroup, said Rhed Schlos, Novell specialist at Brigham Young University. Many LAN administrators at various university work-

groups are Macintosh users, he added. In general, the need to administer two separate environments — NetWare and AppleTalk — with a gateway in between, raises the hassle factor for LAN administrators, Schlos indicated.

In addition, providing services to Macintosh desktops takes up a lot of CPU power on NetWare 4.01, Schlos said, at least partly because of the overhead generated by the gateway.

Novell will address the majority of the problems described above with the following four-phase rollout:

■ **Phase 1:** IPX protocol stack on the Macintosh, later this year. Third-party products such as Claris Corp.'s FileMaker will support the IPX implementation on the Macintosh, as well as a Windows implementation. This will enable the two

client systems to share files over IPX without going through NetWare. Hanson said. Roughly 20 developers, including On Technology, Inc., have announced ports of the software to IPX on the Macintosh.

■ **Phase 2:** Macintosh access to the NDS global directory, later this year. Novell will provide utilities that enable a LAN administrator to use NDS to configure printers on the Macintosh, Hanson said. Novell will also provide support for Apple's Open Collaborative Environment workgroup solution.

■ **Phase 3:** NCP on the Macintosh, sometime in 1995. This will finally enable Macintoshes to access NetWare file and print services directly and be managed by NetWare Management Services, including security and authentication services.

"Users are telling us that they want Macs to be more manageable [the Mac's file system] AppleShare isn't very secure," Hanson said. Also, major database vendors such as Oracle Corp. will port their client software to NCP on the Macintosh, enabling Macintoshes to access SQL database services on NetWare.

Full NCP support will also allow Macintoshes to access the Global Message Handling System without going through an AppleTalk-to-NetWare gateway, as they must now, Hanson said.

■ **Phase 4:** Extension of Personal NetWare peer-to-peer communications and resource sharing beyond its current DOS and Windows clients to the Macintosh in a 1995 time frame.

## MAPI support anchors SQL Server

By Stuart J. Johnston

Microsoft SQL Server's latest revision of its server database also support for some features that developers have been waiting for.

Microsoft SQL Server Version 4.21, which runs under Windows NT, broadens support for Banyan Systems, Inc. and TCP/IP networks, adds a push-button facility for porting OS/2 SQL Server databases and provides support for Windows' Messaging Application Programming Interface (MAPI) 1.0.

The release also makes simultaneously available editions for Intel Corp. processors, Digital Equipment Corp.'s Alpha AXP and MIPS Computer Systems, Inc.'s R4x00 processors.

While the push-button conversion facility gained some praise, one major developer tossed his vote behind SQL Server 4.21's MAPI 1.0 support.

"MAPI is very important to us [because] it means we can do some things within transaction blocks that we couldn't do before," said Bill Cornfield, president of The Windows Support Group, a New York-based consultant. The company's clients include the National Football League, Andersen Busch, Inc. and American Express Co.'s Gold Card division.

Support for MAPI technology will replace "some 'roll-your-own' code," Cornfield said.

MAPI was developed as a high-level protocol to standardize messaging between front-end client applications and back-end messaging servers, allowing cus-

tomers to mix and match front and back ends.

SQL Server 4.21 can use MAPI to use triggers and stored procedures and automatically send the results of database queries as electronic mail to other applications. The functions can be used, for example, to e-mail to users or database administrators when a specified event occurs.

However, the only version of MAPI supported under Windows is the so-called "Simple" MAPI, which requires users to communicate through Microsoft Mail.

Windows 4.0, due to ship by year's end, will add MAPI 1.0's generic messaging support, according to Microsoft officials.

### Socket support

Broadened support for Banyan's Vines lets SQL Server automatically register with the system as a StreetTalk-addressable network service, enabling users to access the database management system as they would any other service.

Increased TCP/IP support now includes client connections using the Windows Sockets interface.

"We've always supported PC desktops using the na-

tive LAN's mechanisms such as named pipes," said Gary Voht, SQL Server group product manager. "What's new is that in addition to Microsoft's TCP/IP stacks, we now support any vendor's stack that supports Windows Sockets."

The push-button SQL Transfer Manager copy management tool provides automated transfer of databases between SQL Servers.

"We anticipate a lot of environments where people have both RISC and Intel database servers and can't just exchange binary files," Voht said. There [are also] a lot of customers integrating NT into environments where there are existing Sybase or OS/2 SQL Servers so they can move the databases into NT rapidly."

Purchasers of Microsoft SQL Server 4.2 can upgrade for \$29.95 for the Enterprise Edition. The desktop edition of SQL Server for stand-alone use costs \$995, and the workgroup edition, which supports 10 users with 25 connections, costs \$1,995.

Microsoft offers two editions of its Enterprise System, both supporting unlimited numbers of users. The Intel edition costs \$14,995, and the RISC edition costs \$19,995.

## Management software

## Doctors prescribe software for patient record woes

By Mitch Fleiss  
WASHINGTON

Calling it the best software available for the practicing internist, the American Society of Internal Medicine (ASIM) recently gave its official endorsement to a patient records and office management software package developed by Medical Logic, Inc. in Beaverton, Ore.

The Washington-based association's endorsement of ClinicalLogic marks the culmination of a two-year process in which offerings from more than 300 vendors were reviewed. The action also marks the first time a major medical association has endorsed a software package for electronic patient records.

ASIM said it hopes the solid move will encourage the nation's 140,000 internists to overcome their reluctance to move away from paper clinical records.

## Time to move

Electronic retrieval of patient information is a central element of health care reform legislation and many re-engineering efforts in the private sector. However, less than 5% of physicians have taken the electronic plunge.

"The demand for electronic data by insurers, hospitals and others... will continue to grow with or without prodding from lawmakers," said Alan R. Nelson, ASIM's executive vice president.

"Physicians who make the changeover now to electronic records will be ahead of the game," he said. "Because they'll be better able to measure things like outcomes, quality and cost-effectiveness."

The Medical Logic software — developed by Dr. Mark Leavitt, a board-certified and practicing internist — stood out because it is tailored to the actual work habits and requirements of internists, ASIM officials explained.

"Our patients often have complex, multi-

ple illnesses requiring comprehensive treatment and documentation. As a result, internists' offices often turn into pa-

perwork jungles," Nelson said. The software is meant to streamline office processes, reduce paperwork and, ultimately, improve patient care.

## 24-hour service

The core of the software is ClinicalLogic, a system for electronic patient records that allows physicians to access patient data even when they are away from the office, thus improving after-hours care.

The software also has modules called Pharmacologic for selecting the most cost-effective drugs and avoiding drug reactions; ScheduLogic for appointment scheduling; and LinkLogic for integration with compatible software products.

The software runs on stand-alone Intel Corp. 486-based PCs and Ethernet networks using Aristo, Inc.'s LANtastic 5.0 or Novell, Inc.'s NetWare 386 operating systems. The cost of ClinicalLogic is roughly \$1,000 per user, depending on options and configuration, a spokeswoman said.

ASIM signed an agreement with Medical Logic that allows the vendor to use the endorsement in its marketing campaign. ASIM members will get a 10% discount on purchases of the software.

## Scanner turns paper into E-mail

By Lynda Radonovich

■ In the latest step toward helping users reduce paper on their desktops, Visioneer, a Palo Alto, Calif., startup, has begun shipping a desktop scanner and related software that works with leading electronic-mail systems.

The scanner, called PaperMax, is about the size of a tall roll of aluminum foil. It is smaller and, at \$499 for hardware and software, cheaper than "even crumby" scanners available today, according to beta tester Dave Dahlberg, a partner in design firm Charlotte Anderson Design in Bountiful, Utah. It is also more robust than household scanners, he said.

PaperMax plugs into a computer's serial port and can scan one sheet in roughly six seconds, according to users who have tried it. The scanned image then appears on the Windows desktop. Related MaxMail software lets users manipulate the images and link them to E-mail, fax and optical character recognition applications. A separate viewer utility lets users without the Visioneer system view, print and save the images.

## Get in line

Marc Kaffner, a senior analyst at a major food manufacturer in Richmond, Va., said he envisions equipping remote personnel with the scanners so they can scan in expense reports

and receipts from the field.

"It's another driving force behind our move to a paperless office," he said.

However, Kaffner said the product works only on Windows machines and that users can scan only one sheet of paper at a time.

Several E-mail vendors rallied behind the Visioneer scanner. Lotus Development Corp., Da Vinet Systems Corp. and Delrina Corp. said that they are bundling the MaxMail viewing

MaxMail software allows manipulation of images input using the PaperMax scanner

software with all forthcoming releases of their messaging products.

However, MaxMail is not shipping with Microsoft Corp.'s Mail because that product does not include utilities that allow users to view other document formats, according to Shelby Harrison, a vice president of marketing at Visioneer.

## Servers target users who 'outgrow' PCs

By JOHN S. BOZMAN

Netpower, Inc., a Silicon Graphics, Inc. spin-off, recently announced RISC servers for Windows NT aimed at the "upsizing" market of Windows users whose applications are outgrowing Intel Corp. PC-based hardware.

The Sunnyvale, Calif. firm is shipping two high-end Microsoft Corp. Windows NT servers priced from \$5,295 to \$28,180. Netpower announced its first product, a series of NT-based workstations built on MIPS RISC chips, in September (CW Sept. 27, 1993). The servers will be marketed to users who need more power to run their Microsoft SQL Server for OS/2 databases, industry analysts said.

## More to come

Industry analysts said Netpower has an early lead in the NT server market but will soon be competing with servers from Digital Equipment Corp. and AT&T Global Solutions, formerly NCR Corp.

"This [server] will play extremely well in companies that are trying to consolidate their [IBM] OS/2 servers without going to Unix," said John Loggia, executive vice president at Aberdeen Group in Boston. "Those people are under intense pressure to upgrade to Unix and are finding only incremental improvements from powerful PC servers."

**Tightening up**  
One such site, Chemical Banking Corp.'s Risk-Management Division, is evaluating the Netpower servers with the aim of consolidating several Microsoft SQL Server for OS/2 databases on a single 200-byte database server.

"We are duplicating a production SQL Server database," said Paul Seides, technology manager at the 400-person Chemical Bank unit. "We are kicking the wheels to see how it comes out."

Seides said that the New York site, which has Novell, Inc. file servers, would like to stay in the Windows operating environment.

SUPERHUB VENDORS MUST  
USE SUPER-PERFORMANCE, 92

Stan Schatt

## Mobile workers get no respect

**P**ity the poor mobile worker. Vendors promise the perfect portable office in a briefcase for only the price of their particular cellular modem, nonstandard PCMCIA card or remote network communications software. Now comes the latest not-quite-ready-for-prime-time mobile product: Intel's ProShare Personal Conferencing Video System.

Think of it. Imagine yourself in your hotel room, an oasis from explaining some bad news to your boss. If only you could call her and see her face while you explain why the Fidget Widget 1000 is going to come in over budget. At least you can switch conversational tactics if you see her beginning to frown. Long pauses in the conversation are less frightening if you see she is not reaching for your personnel file.

But Intel's personal videoconferencing suffers from the same weakness as many other products developed by the computer industry. It was designed by people who love technology for people who would just as soon have the technology transparent. When you pick up a telephone or dial a phone number, you don't care how these devices work, and you don't want to be forced to make technology decisions among these products. (Will this phone work with my particular phone line?)

### What you want is not what they've got

You would like to believe that if it is sold, the product will work with whatever equipment the average person has. But that's not the case with Intel's product, even though it was the hit of the ComNet show and attracted huge crowds. I watched the 15 frame-per-second video on a PC screen and realized that pictures from the moon actually seemed more lifelike. But hey, it was someone's face right smack on my PC screen, and that's an exciting idea.

OK, sign me up, you might be saying. Not so fast. To see video from a remote user, there has to be an ISDN line. At the end of Intel's ComNet presentation, an actor says with deadly earnestness that Intel is working with the telephone companies to ensure that ISDN will be installed in your area as soon as possible. Perhaps Intel will have better luck than the major computer manufacturers and millions of customers who have found the telephone companies quite a bit less friendly than their emotional television commercials might suggest.

Out of curiosity, I called Pacific Bell and discovered that in San Diego there are only two small pockets of ISDN. My company is the single largest telephone customer in San Diego county and is not able to access ISDN. I guess this makes lots of sense if you are a monopoly and prefer to keep all your customers equally discontent rather than to give certain customers preferential treatment. Let's assume that somewhere Pacific Bell came to my door tomorrow and told me I had an ISDN line directly to my office. Could I call the office while working at home and see my boss if we both have the appropriate Intel equipment? The answer is no. It seems that there are no adapters yet for notebook computers. Mobile computer users simply get no respect.

Schatt is LAN service director at Computer Intelligence/Info Corp in Los Angeles, Calif.

## Fiber may make more cents

Lower prices could make fiber an economical option for all

By Stephen P. Klett Jr.

**Laying fiber to the desktop may have many benefits, but it is so expensive that only the most bleeding-edge users have embraced it. That, however, will likely change within a year.**

Analysis says the price gap between Category 5 unshielded twisted-pair cable and fiber has narrowed to the point that fiber may become a viable option for everyone. Observers estimate that installing fiber to the desktop costs from \$1,200 to \$2,500 per network node — about 25% higher than comparable costs for unshielded twisted pair.

### Economic sense

"Technological superiority and declining fiber-optic system costs are making fiber an economically viable alternative to unshielded twisted-pair cable," said Fred McClimans, an independent network consultant in Ashburn, Va. McClimans added that this is especially true given the fact that the installation skills required to install and maintain copper cable have increased (see box page 54).

Nevertheless, the premium for fiber is one that some users are willing to take in the short term, with expectations for payback over the long haul.

### New cabling on the way

According to Gartner Group, Inc., 47% of 200 large firms surveyed plan to install new cabling within three years and 17% plan to allocate funding for 100% bi-directional speeds to the desktop within 12 to 18 months.

For example, the Richardson Independent School District in Richardson, Texas, is installing fiber to the desktop at its roughly 50 schools, four administrative campuses and 55 libraries, according to Troy Sprenger, network systems engineer.

### Doing it right

"Managers were sick of us coming in and saying 'I need more bandwidth, higher reliability, etc.,'" Sprenger said. "We are under extensive financial pressure to get it done and get it done right — or get out."

While fiber costs an extra \$23/drop (see chart), Sprenger said information systems was able to persuade management to spring for the extra cost because the fiber is expected to remain in place for at least 10 years of service without additional investment. "We were stuck in this trend of having to recable every two or three years, which was not economical," he said.

But some analysts said fiber is misadventured in the cost arena. "Everything comes down to cost, and on the surface copper appears to be the better deal," McClimans said. "However, reinstalling cable every five years is not cost-effective — you should get at least 10 years out of a cable infrastructure."

Fiber, page 54

Worth the price?	
The Richardson Independent School District put out bids to equip a trial building with Category 5 twisted pair cable and fiber-optic cable.	
This is how the costs broke down:	
CATEGORY 5	FIBER-OPTIC
CABLE 18,300 FEET \$4,026	CABLE 18,300 FEET \$8,118
LABOR 480 HOURS \$10,800	LABOR 528 HOURS \$11,880
SUPPLIES \$2,700	SUPPLIES \$1,600
TOTAL COST \$17,526	TOTAL COST \$23,598

### Wireless communications

## FCC modifies rules, licenses

By Michael Fitzgerald

The fog surrounding wireless communications cleared a bit recently when the Federal Communications Commission modified its spectrum allocation rules and assigned licenses to certain carriers of both narrow-band and broad-band personal communications services (PCS).

PCS is expected to offer users an alternative wireless communications medium to cellular. PCS will probably become fully operational in the next two years. Narrow-band PCS will be used for two-way paging and other types of communications that handle small bursts of data. Broad-band PCS will compete with cellular communications.

Still, the FCC maintained its pol-

icy of granting two licenses per local market to promote competition, though it will examine how well this duopoly strategy is working in the cellular phone market.

"With only two competitors in every cell, there is no pricing pressure whatsoever," said Kimball Brown, an analyst at Datapoint, Inc. in San Jose, Calif. Brown said high prices forced on cellular by the FCC have limited the cellular phone market to 13 million units.

Specific FCC actions included the following:

The commission established a licensing format that allows for 11 nationwide licenses, six addition-

al regional licenses, seven licenses for "major trading areas" and two each for "minor trading areas," such as cities.

Based on "pioneer's preference," which rewards companies for technology innovation, the FCC assigned three licenses for broad-band PCS to Cox Communications, Inc., American Personal Communications and Omnipoint Communications, Inc. This does not preclude other companies from being granted licenses in the same metropolitan area.

Also based on pioneer's preference, the FCC affirmed its decision last summer to grant Mobile Telecommunications

Technologies, Inc. a license for narrow-band PCS. The other 10 nationwide licenses will be auctioned off in the future, according to the FCC.

### FCC takes five

The FCC established five regions for narrow-band PCS and established a major trading area in these regions.

# Internet users batten down hatches

Security measures are on more users' minds

By James Daly and Gary H. Anthes

The widely publicized attacks on the Internet in recent weeks have splashed the open electronic playground with a dose of cold reality and sent newcomers scrambling to beef up network security plans.

"All these companies that were not even aware of the Internet now believe they can't live without it, and most are totally ignorant of the risks," said Robert Kane, a partner at Intrusion Detection, Inc. in New York.

Internet-ers have been particularly hard hit in recent times. The latest in a series of security breaches came earlier this month [CW, Feb. 14].

## Security lacking

Internet veterans say the attacks are nothing new, but they may come as a shock to electronic novices. "Any network hooked on the Internet could be at risk for a security break," said James Settle, a special agent at the Federal Bureau of Investigation's national crime squad. "Most networks are very open,

and security isn't very good."

In recent years, as the Internet has changed from the casual chat line of the academic and research communities to the playground of the computationally hip, attacks like the recent recovery of stolen password files have increased. The influx has created a new breed of intruder who uses sophisticated software programs designed to automatically probe the Internet looking for system weaknesses. But a heightened sense of security is creeping in.

"People are really beginning to tighten down and watch what is going on," said Ken Jones, systems and network administrator at Group One Ltd., a San Francisco stock options trading firm that uses the Internet extensively.

Jones uses routers at four sites to specify the kinds of traffic allowed into and out of the company, where connections may be made and by whom. He said he changes passwords frequently and monitors security logs for suspicious activity such as failed log-in attempts.

Experts say the most important aspect of maintaining security is the regulation

Security, page 64

Distributed game of doom may cause LANs to crash

By Ellis Bookler

A popular game being downloaded by Internet subscribers can overload LANs, causing them to slow down or even crash, according to several sources.

Called "Doom," the real-time multiplayer game uses sophisticated three-dimensional graphics and sound. The shareware program is now being offered commercially. The game's creators could not be reached for comment.

The problem, according to experts familiar with this kind of program, is that it uses broadcast messages — up to 100 per second — to link players across a network.

Jaime Carbonell, director of the Center for Machine Translation at Carnegie Mellon University in Pittsburgh, said so-called "distributed" games such as Doom can set up "broadcast storms" as multiple sites send out and receive the game's broadcast messages.

He said the impact depends on how many sites broadcast at one time and how fully loaded the LAN is at that time. "So far as I know, it's not going to screw up anything permanently, but it will slow up whatever nodes you broadcast through or transfer messages through," he said.

Multipayer, real-time distributed games are relatively new. Carbonell said. The earliest, Dungeons & Dragons, used only text messages and therefore was not as taxing on networks. Carnegie Mellon originated a game in this category called Tiny Mud, which lets players jointly create an artificial world.

Another popular multiplayer game is Netrek, according to Brian Johnson, a communications consultant in White Plains, N.Y. But reports of network difficulties have focused on Doom, he said.

## Double the mischief

Recent bulletin board postings on the Internet, Johnson said, indicate the game can cause two kinds of unintentional mischief for Token Ring networks, which have reported the program can lock up machines. "The other problem is it saturates networks quickly," said Johnson, who said a way to obviate this problem is to dedicate one machine as the game's server.

Finally, Johnson said, Doom's unintended impact on networks underscores a larger issue: for all the talk about collaborative, network-based computing, current networks are not up to this task. "But think about it... this is the direction all networks will have to go," he said.

# Superhub vendors must super-persuade

by Stephen P. Klett Jr.

While users say they are encouraged by recent developments in the "superhub" arena by SynOptics Communications, Inc., Chipcom Corp. and Cabletron Systems, Inc., they plan to immerse themselves in the technology slowly.

"Today nothing is so unique among the vendors that makes any one stand out heads and tails above the rest," said Sam Picotte, vice president of telecommunications at Home Savings of America in Irwindale, Calif. "We plan to wait to see how things shake out before we make any major financial commitments."

Analysts agreed that each of the vendors faces a formidable task in enticing users to commit to their platforms.

## Takes convincing

"The biggest challenge for each of the hub vendors is to convince end users that this type of advanced architecture is something they really need today," said John Morency, a principal at Strategic Networks Consulting, Inc. in Rockland, Mass.

While the Big 3 offer many of the same capabilities (see chart at right), including virtual networking, analysts said Cabletron's MMAC-Plus and Chipcom's OnCore system have a leg up on SynOptics' Lattis System 5000 in terms of support for asynchronous Transfer Mode.

SynOptics, however, said it will offer these capabilities by year's end through a modular form of its EtherCell switch, which was announced last week.

Virtual networking eliminates a lot of the work associated with wiring closet changes by allowing network administrators to create logical workgroups of users — regardless of their physical location — by cutting and pasting individual nodes on a central workstation.

The costs of physically making these moves can pile up quickly. Forrester Research, Inc. in Cambridge, Mass., estimates that network management costs associated with moves, adds and changes total \$2.1 million per year for a medium-size company of 500 people.

Virtual networking is very intriguing to Home Savings, which Picotte estimated spends up to 100,000 per month on visits to the wiring closet to perform about 300 changes. "The Cabletron box could eliminate the bulk of this expense," he said.

The Big 3

While more expensive than its competitors, Cabletron's MMAC-Plus offers users routing capabilities and a higher port density

VENDOR/PRODUCT	CABLETRON MMAC-PLUS	CHIPCOM ONCORE	SYNOPTICS LATTIS SYSTEM 5000

**H**ewlett-Packard computer systems help General Mills crunch their delivery schedules. So you get your Wheaties even fresher.

*"Not only is the HP 3000 open, but it's an excellent, easy-to-use transaction-processing system for business-critical operations."*

— Mike Morris,  
General Mills, Information Systems

**T**he demand for Wheaties®, Cheerios® and other General Mills® products is huge. Which puts enormous demands on the company's distribution and inventory control systems.

They needed a way to deliver faster, while making sure each shipment was complete and contained only the freshest products. They solved the problem crisply by porting a UNIX-based warehouse management application to HP 3000 computers.

This is helping General Mills perform like a champion. The HP 3000s, located in all nine distribution centers, are managed remotely, without extra staff. And they provide near 100% uptime. Which takes the worry out of running critical applications.

If you need a faster way to market, call 1-800-637-7740, Ext. 7804 for a video case study. We think it will whet your appetite for more.

Think again.

Working Together™

## Security measures on users' minds

CONTINUED FROM PAGE 50

of access. Procedures must accommodate two opposing requirements — the need for strict control vs. guidelines that users must follow carefully.

### Limited access

For some, the best approach is to centralize and simplify access. For example, the U.S. Environmental Protection Agency set out to give all its major offices an Internet gateway. Then security concerns forced it to have all access flow through a single carefully protected site.

"It's a stand-alone server," said Brad L. Niemann, a scientist at the EPA's Environmental Statistics and Information Division. "If someone comes in and hacks, they might destroy the server and its software — which is backed up — but they can't pass themselves through to other agency resources."

One user at a large professional services firm uses InterLock from ANS Core Systems, Inc. in Elmsford, N.Y., to guard against Internet-borne mischief. It consists of software running on a "firewall" computer that controls access to the Internet and vice versa. A user-maintained rules base limits traffic going in and out by person, function performed, host, network, time of day and day of week. It can block access to any of the Internet commands that hackers often exploit.

"Anything you can do to make it look hard [to penetrate] is worthwhile," the

user said. "So many people have taken no security precautions they'll go after the easy pickings out there."

It is crucial to discourage users from sharing passwords with co-workers. Software that forces users to periodically change their passwords is also useful,

especially if it prevents selection of an old password. It's especially strict with user accounts that have system privileges.

Data encryption is also important. After creating a new message, an encryption program can be used to scramble it into an incomprehensible format. The encrypted file is then transmitted, and the receiving computer uses the encryption program to decrypt the data into a meaningful format.

Not surprisingly, the computer security experts at Trusted Information Systems, Inc. in Glenwood, Md., have taken extensive precautions after being hit last fall.

### Encrypting a must

The company has installed firewalls at all sites and uses "challenge/response" mechanisms — which effectively encrypt passwords — to prevent the interception of plain-text passwords. "They are an absolute must," said President Stephen Walker, who added that the company will soon begin encrypting all Internet communications.

It takes some coordination to put security measures in place, but Internet veterans say the safety of your company's data hangs in the balance.

"Many folks are just oblivious," said Padgett Petersen, a security manager at Martin Marietta Electronics in Orlando, Fla. "And it's often those who don't think there is any danger who are in the greatest trouble of all."

## Wolf unveils Notes, CC-Mail network service

WorldCom Communications Co. in Houston has begun offering a network service for Lotus Development Corp.'s Notes and CC-Mail users. Called WorldCom, the network provides dial-up or Internet access to Notes or CC-Mail mailboxes, and it lets users connect to other electronic-mail networks.

WorldCom's main benefit is that it lets companies access wide-area services without setting up a wide-area network. WorldCom provides the CC-Mail and Notes server and the X.400 gateways to other services.

The first major WorldCom application is a Technical Support Alliance Network (TSANet). TSANet is a vendor technical support alliance that will allow member companies' technical staffs to share information via Notes databases on the WorldCom network. Full-scale implementation is slated for March 1.

TSANet members include 3Com Corp., Apple Computer, Inc., Borland International, Inc., Hewlett-Packard Co., IBM, Lotus, Microsoft Corp., Novell, Inc. and WordPerfect Corp.

—Lynda Radzowicz

## Fiber

CONTINUED FROM PAGE 49

With fiber's ability to handle very high bandwidth rates, this feature is virtually guaranteed. The same cannot be said about copper, which has to be stretched to the limit to handle 100MB/sec speeds. The promise of longevity is what drove Belden Corp. to install fiber to the desktop at a division in Fargus-Morris, N.C. — a decision that was not made lightly, according to Paul Mullen, senior network engineer. "We're a very thoughtful company — we don't look to be on the bleeding edge," he said. "However, we needed something that would carry us into the future, and with fiber we're good

for the next 15 to 20 years."

Mullen was given the directive to design an "economical, state-of-the-art" network that would not require continuous change and upgrades. "Fiber was the only answer," Mullen said. "And when you spread the extra 25% cost of installing the cable over a period of 12 years, we feel it will be very economical as well."

Some users, however, remain skeptical.

"An extra \$30 a drop is a big dent to get approved when you've got thousands of nodes," said one network administrator at a large Midwest banking firm who asked not to be named. "It still has to come some more before we'll take a serious look."

## Fiber and cable under the microscope

**B**oth unshielded twisted-pair copper and fiber cable have their strong and weak points. Copper, for example, is much more delicate than fiber, which leaves little margin for error during installation. Stretching or crimping the wire can hamper its ability to provide 100M bit/sec. performance.

In addition, copper is highly susceptible to electromagnetic interference, which is emitted by common office fixtures such as photocopiers and fluorescent lights. This means that more care, time and, therefore, money are needed in the planning stage to avoid this equipment.

For its part, copper Category 5 cabling is the media of choice as an interim solution to providing 100MB/sec. speeds to the desktop.

At the moment, fiber's main claim to fame is as a backbone. However, fi-

ber offers several advantages, including the following:

- ▶ Lower data transmission error rates than unshielded twisted pair
- ▶ Support for high-speed transmission over longer distances, which minimizes the need to purchase devices such as hubs and repeaters
- ▶ Support for the highest data rates of any cabling media currently under consideration for the desktop, including Asynchronous Transfer Mode speeds of 622M bit/sec. and beyond.
- ▶ Greater tensile strength copper or steel wire of the same diameter that is resistant to most of the corrosive elements that hamper copper. Relative to Category 5 unshielded twisted pair, fiber cable is 25% to 40% lighter and occupies as much as 15% less space, according to the Fiber Optic LAN Section of the Telecommunications Industry Association.

—Stephen P. Klett Jr.

digital

W

Anticipation. Apprehension. Anxiety. For the Xikrin of Brazil, the transition into adulthood can be exciting and more than a little nerve wracking. If you're trying to manage multiple database management systems on multiple platforms, you've no doubt encountered many of the same feelings. While there isn't much we can do to help the young Xikrin males, we can make things a lot easier on you.

On January 12, 1994, PLATINUM technology, inc. acquired Datura Corporation. This acquisition enables us at PLATINUM to extend our unparalleled database management tools and expertise from DB2® to other relational database management systems such as Oracle® and Sybase®. At the same time, it allows us to give you the support and service of a mature software vendor. By acquiring Datura, we are now able to offer a rich suite of four Microsoft® Windows™-based database administration tools for Sybase, Oracle, and Microsoft SQL Server®:

**DATURA DESKTOP DBA™** is an administration and migration tool that simplifies database server management. Desktop DBA provides unparalleled functionality for managing SQL database servers, and eliminates the need for complex SQL commands. Database administrators can manage various database management systems at once, utilizing the power and ease of Windows. For example, an administrator can use Desktop DBA to copy complete databases across servers by simply using the drag and drop method.

**DATURA SQL SPY™** is a SQL database monitoring tool that enables database administrators and developers to

monitor SQL servers using predefined events (such as CPU, I/O, or locks) or unlimited user-defined events (such as SQL application usage). SQL Spy allows users to monitor multiple events on multiple servers at the same time for easy side-by-side database comparisons. It also provides record and playback modes so administrators can analyze and tune databases as needed.

**DATURA SQL PORT™** works with Desktop DBA to provide a high-speed method for importing and exporting. By pointing and clicking, users can easily transfer a table, all of a user's specified tables, or a complete database.

**DATURA SQL COMMANDER™** is an advanced query and information delivery tool that provides a gateway into many common applications and data sources. SQL Commander can deliver the information obtained from queries directly into word processing and spreadsheet programs. Its advanced import/export data conversion capability (SQL Port) enables users to move data easily between SQL sources.

At PLATINUM, we will continue to expand support for our enterprise-wide database management products so they can work with additional DBMSs - including DB2®, DB2/2®, and DB2/6000® - on a variety of operating systems such as MVS, OS/2®, and UNIX.

If you'd like a free 30 day trial, a demonstration of these products, or a PLATINUM client/server kit, we have two pieces of advice: stay away from poisonous ants, and pick up the phone and give us a ring at 1.800.442.6861.

## Ford drives exclusive outsourcing deal

By Mark Halper

**When Ford of Europe's Parts and Services Operations decided to outsource computer operations, it made one unequivocal point to prospective vendors: When it came to the automotive industry, its outsourcing was to work for Ford, and Ford alone.**

The \$2.4 billion Cologne, Germany-based Ford division was, after all, in the process of automating its inventory control, delivery and invoicing procedures into what the company said will give it an advantage in the hotly contested European market.

So what good would it do, wondered Nick Bartolini, parts and services vice president, to bring in a partner that might earn around and give a boost to Volkswagen AG, General Motors Corp., Fiat SpA or any other rival? "I made it very clear right from the outset. If you're going to do business with Ford's Parts and Services Operations, it's us and only us in terms of the automotive industry," Bartolini said.

Earlier this month, Ford signed a five-year deal with Computer Sciences Corp. (CSC). The company will take over data centers in Cologne, Coventry, England, and Valencia, Spain, and will develop new applications geared at improving the efficiency of Ford service operations throughout Europe.

The exclusivity helps underscore the age-old concern of outsourcing customers that allowing an outsider hands-on access to the family jewels could be a competitive faux pas. But Watkins, CSC's European outsourcing director, noted that while information technology shops commonly raise questions of exclusivity during outsourcing negotiations, the issue is not always addressed contractually.

Although the Ford/CSC contract is "legally vague"

about CSC's right to do business with CSC's competition, Bartolini and Watkins both said the spirit of the agreement confines CSC to Ford.

"We would regard it as unfriendly action" if CSC were to sign itself with another automaker's parts and services program, Bartolini said.

The exclusivity also puts bite behind the pervasive bark of outsourcing vendors that claim to be customers' partners. A willingness to forego other jobs in opportunity-rich industries such as automotive instills a vested interest in contributing to the success of the customer, analysts noted.

### Building a relationship

"It's good common sense," observed Susao Serpinski, editor of "The Integrator," a newsletter in Barnegat, N.J. "You don't want your outsourcer doing business with a major competitor. This shows the deepening relationship between outsourcers and their clients."

Watkins explained that while CSC has agreed not to pursue business with the parts and services operations of Ford's competitors, it might be able to pursue automotive contracts in other facets of the industry. "But before doing that, we would check with Ford to see if it was an issue with them," Watkins said.

Of course, CSC sees a sound business proposition in the Ford deal. The contract brings three European data centers with a combined 72 MIPS of IBM and Amdahl Corp. mainframe power into CSC's fold, a development that should help the El Segundo, Calif.-based outsource-

er continue on its European hot streak (see chart). CSC is free to use those centers to process other customers outside the automotive industry.

Sources said the deal is worth about \$100 million a figure Bartolini described as "in the ballpark." The value depends on how much development work Ford assigns to CSC and how quickly it wants the work done. A rush order would cost Ford more than a job requested over a longer period of time, he said.

One of the reasons Ford chose CSC was its ability to "parachute in" if Ford encountered a sudden need for technical or human resources, Bartolini said.

CSC is stepping in as the Ford Parts and Services Operations overhauls its computer systems and general procedures. Ford's aim is to help dealer service centers across Europe have an up-to-the-minute, on-line accounting of what parts are in stock or at least available from a nearby service center. A system called Dealer Computer Architecture Strategy has reduced the front-end time of locating parts from about 20 minutes to about two seconds, Bartolini claimed.

Ford has similar ambitious strides in mind for other parts operations and to that end will contract CSC with privileged, proprietary information that in the dog-eat-dog competitiveness of the auto industry has not yet made its way to the outsource.

"There are some things we guard rather jealously," Bartolini said. "CSC will very shortly become involved in some of our leading-edge programs."

### Software support

## Digital revamps transaction strategy

By Craig Stedman

Digital Equipment Corp.'s plan to support both IBM's and Transarc Corp.'s transaction monitors on the Alpha AXP systems line gives the company a much more compelling transaction processing strategy than when it was relying solely on its own transaction processing software, industry watchers said.

"Six months ago, Digital had the most confusing transaction processing strategy in the industry, and now that has gotten flat fixed," said Wes Metling, an analyst at Gartner Group, Inc. in Stamford, Conn. The plan follows Digital's formal embrace with IBM RS/6000 systems and Hewlett-Packard Co.'s HP 9000 line, Metling said. The HP 9000 supports both

CSC/9000 and Encina.

Metling also praised Digital's plan to layer CSC/9000, Encina and its own Application Control and Management System (ACMSsp) transaction monitor on top of Transarc's Encina Core Services tool kit and the Open Software Foundation's Distributed Computing Environment (DCE). That should let users create applications that can take advantage of more than one of the monitors, he noted.

### Learning the lingo

While Digital is getting praise for its overall client/server software strategy, including the transaction processing plans, there is still some skepticism about the company's ability to train its much-maligned sales force to explain the intricacies of the strategy to users. "I'll believe that when I hear it getting said back by a big customer," said Wes Metling, a Gartner Group analyst.

Marc Schulman, president of Technology Strategies Group, a consulting firm also based in Stamford, agreed that the licensing deals with IBM and Transarc were two of the highlights of Digital's Feb. 8 product and strategy announcement related to its so-called software frameworks (CW Feb. 14).

Ted Faigle, group marketing manager for production systems software at Digital, said the three transaction monitors should be able to access common databases via X/Open Co.'s XA data interface standard. Digital is also working to allow different parts of an application to be split among the monitors, he added.

That will be accomplished with X/Open's Transaction Remote Procedure Call (TxRPC) specification, which Digital initially developed as part of a multivendor architecture for NTT Corp.,

Faigle said TxRPC support is likely to be available in early 1995, at least for ACMSsp and Encina, he added.

### Users take a look

Allan Cobb, director of the student information systems architecture at York University in North York, Ontario, said he now expects the school to "look very closely" at an Alpha-based setup for a distributed transaction processing project that is in the planning stages.

"DCE is a key technology for us," said Cobb, who is already running DCE applications on Alpha hardware. York wants

# Airline caught in Unix undercurrent

Users cite common obstacles to implementing Unix code

By Jean S. Bosman

American Airlines' Unix expertise, which has helped it create systems for its own use and for other carriers, has not prevented in-house software developers from tripping over some common implementation problems.

These problems include recompiling software to run on different Unix versions, the lack of robust systems and network management tools, and cost savings that vary by type of application.

Fortunately, one commonly stated reason for adopting Unix, is often accomplished through several weeks of migrating code from one Unix platform to another. "It's anywhere from a couple of weeks to two or three months, depending on the products," said John DiNovo, director of internal systems at American Airlines Decision Technologies (AADT), an in-house systems integration business unit owned by American Airlines parent AAR Corp.

## What's needed

Topping the AADT developers' wish list are standards-based systems management suites that would handle job scheduling and resource management as easily as it does in-flight cabin crewman. said Steve Clampett, AADT's vice president of development.

Even AADT's in-house systems need better resource managers. "We have about 1500 bytes of on-line magnetic storage," DiNovo said, "and we want to go out and get some third-party vendors to help us manage it." Industry analysts say they expect a new generation of systems management tools will simplify distributed computing operations by the late 1990s.

Standards of another sort, including Net-

work File System, TCP/IP and the Open Software Foundation's Motif window manager, have already helped to create client/server applications in a Unix environment. They also help cut costs, Clampett said. "Many of these applications are fairly complex-intensive, and the only way we can economically deliver them is on a Unix platform."

Some mainframe applications tend to preempt other CPU tasks—a problem now avoided by running the Unix versions of these systems on dedicated hardware, said information systems managers at American Airlines.

## What's saved

Cost savings from the new generation of Unix systems vary, users have found. AADT's original goal was to have the Unix systems it developed pay for themselves within a year (CW, July 13, 1992).

For one of AADT's first customers—American's own flight operations business unit—that was true. "We were able to buy the workstations and convert the programs to run on the workstations for less than we were paying to use the mainframe for a year," said Scott Nasson, vice president of operations planning and performance at American in Fort Worth, Texas. Some 20 end users run a flight crew scheduling application on MIPS Technologies, Inc. workstations and IBM RS/6000 servers.

Maintaining the American Airlines' Unix crew-scheduling system costs just "a fraction" of the 20-year-old Fortran-based system it replaced, Nasson said.

But, at Lufthansa German Airlines in Frankfurt, the cost savings had not been quite as dramatic, said Hans Koch, vice president of service and customer systems. That division has

an AADT-designed Unix system running on Hewlett-Packard CA workstations and servers with an Oracle Corp. database. The value of the system, Koch said, is its ability to boost business productivity. "I'm not quite sure we have a lot of money, but I'm sure we can make more money and more revenue with these systems."

Peter Buckingham, systems director at Britannia Airways, agreed that qualitative benefits, rather than quantitative savings, stem from Unix-based decision-support and logistical systems. Gaining user-friendly interfaces and complex interactive computing is a better reason to move from mainframes to distributed Unix systems. "I think the cost argument is a bit of a red herring," Buckingham said. "I don't think you can build some of these new applications in a mainframe environment. If you're [installing Unix systems] just because you think it's cheaper, it's probably a mistake."

## Taking flight

American Airlines Decision Technologies deployed a \$6.5 million Unix network for client/server applications in-house in 1992. Although 30% of its systems are installed at American, outside clients include Lufthansa. Since 1989, AADT's Unix systems have included flight scheduling, pricing management, yield systems and user interfaces to reservation systems.

American Airlines' System Operations Control Center, the heart of the carrier's operations, uses many systems developed by AADT.

# CA/Newtrend marriage heads for divorce

By Thomas Hoffman

From the moment top executives at Computer Associates International, Inc. and Newtrend Group in Orlando, Fla., shook hands on a joint banking software venture in May 1991, the six-member board of directors has agreed upon only one matter: A house divided cannot stand.

The two sides are so polarized they cannot even decide how their joint venture, Newtrend L.P., should be dissolved. The dispute has led the firms to a springtime showdown in Delaware Chancery Court to determine the partnership's fate.

Prior to the partnership, Newtrend had been marketing a savings and loan product for Unisys Corp. systems called Miser2.

However, by the late 1980s, Newtrend was concerned about the financial viability of both Unisys and the savings and loan industry. The company began to explore other growth opportunities, according to Kathleen Healey, who has been tracking the litigation between CA and Newtrend since it began last August. She is the editor of "Bank Automation

News," a biweekly newsletter based in Potomac, Md.

As intermediary led Newtrend into discussions with CA, which was looking to extend its marketing channels for InfoPoint, a commercial banking product for IBM mainframes that CA acquired from Uccell Corp. in 1987.

After CA and Newtrend invested \$34.5 million each in the joint venture, the entity's sales grew from \$77 million in 1992 to \$64.2 million in 1993.

In 1992, approximately 30% of Newtrend revenue was derived from InfoPoint software sales.

## Comeback begins

Meanwhile, as Unisys rebounded financially, so did Miser2 sales. According to Newtrend's 1992 annual report, the company placed 17 new orders for the thrift software during that year.

In addition to InfoPoint and Miser2, Newtrend L.P. has released a series of

new products, including Credit Union Business Environment, or CUBE, a client/server-based credit union software suite.

The two vendors have clashed on the direction of the venture since Day 1, according to both parties.

Under the original agreement, the limited partnership would be co-owned by CA and Newtrend and operated by Newtrend President and Chief Executive Robert E. King and his staff. But CA has three of the six seats on the board, including CA Chairman Charles B. Wang, who also acts as Newtrend L.P.'s chairman, and the two factions have feuded over

the company's operations ever since. Both King and Wang were described by analysts as "strong personalities."

CA declined to comment on the litigation with Newtrend. However, a source close to the Islands, N.Y., software giant said CA wants to split up the partnership so it can regain its InfoPoint software

and an undisclosed sum of cash.

But the Islands customer base has grown since the partnership and has become an integral part of Newtrend L.P., leading Newtrend executives to seek an initial public offering for the unit to keep it intact, according to Robert E. Lund, Newtrend's executive vice president and chief operating officer.

## The matchmaker

Bernie Goldstein, managing director at Broadway Associates in Fort Lee, N.J., was the middleman who brought CA and Newtrend together. Goldstein, who sat on Newtrend's side of the board until last October, said he would like to see the entity remain intact. "When people don't get along, don't destroy an asset. Give it to someone else who can run it," Goldstein said.

Lund said the case is expected to be heard sometime in the second quarter this year.

Earlier this month, William B. Chandler III, Delaware Chancery Court vice chairman, denied Newtrend's application for the appointment of a liquidating trustee who would be empowered to sell the assets of the joint venture and distribute the proceeds to the partners. A court date has not yet been set.

Newtrend's Robert Lund seeks an initial public offering to keep the unit intact.

## Health care group to test open systems

By Mitch Betts

The health care industry, which already has a plethora of data standards groups, now has a nonprofit consortium devoted to accelerating the deployment of open systems.

The Healthcare Open Systems and Trials (HOST) organization, announced Feb. 8, is intended to help solve a big problem for chief information officers in health care settings: the proliferation of proprietary systems. Surveys reveal that the top priorities for hospital CIOs are integrating various departmental systems and exchanging data with other medical facilities.

### To the rescue

The industry group will also help CIOs "sort out the confusion of competing vendor claims of reliability and connectivity," as well as provide some "hard data" for technology investment decisions, said David Morgan, chairman of the HOST board of directors.

The HOST group was co-founded by Austin, Texas-based Microelectronics and Computer Technology Corp., known

as MCC, and the Computer-based Patient Records Institute, based in Chicago.

HOST will have the following features:

- A network of open systems laboratories, where users and developers can test the connectivity and performance of systems before purchase or installation.
- Large-scale, multiyear "integration trials," where emerging technologies will

be tested on regional information networks.

- If technology gaps are identified during the trials, HOST will sponsor technology development projects by MCC.

Does the health care field really need another committee? Ed Heller, president of the Computer-based Patient Records Institute and a former CIO, said HOST

will try to avoid duplicating the work of standards committees and will instead focus on laboratory and real-world tests of interoperability.

Among the organizations that are currently HOST members are 3M Co.'s 3M Health Information Systems unit, the American Health Information Management Association, the American Hospital Association, Ameritech Corp., Digital Equipment Corp., Hewlett-Packard Co., Motorola, Inc. and Sprint Corp.

## Digital

to create an on-line transaction processing environment for student enrollments and course registrations.

The university, however, may start out with "a more lightweight scheme" built around the Encina tool kit only and then move to a more robust installation with transaction monitors during 1986, Cobb added.

Versions of CICS/8000, Encina and ACMSxp for the DEC OSF/1 operating system are all scheduled to ship in the second half of this year on top of Transarc's tool kit, according to Digital.

"Pieces" of the technology may also be introduced late this year for Microsoft Corp.'s Windows NT, Paigle said.

In spite of the new multiplatform strategy, Paigle and other Digital executives indicated that the company is not backing away from ACMSxp. Paigle noted that the Alpha version of the software is "completely portable" and could be supported on non-Digital hardware platforms over time.

## Large Systems

IBM Credit Corp. has introduced IBM Credit AssetNet, a database software application.

According to the Stamford, Conn. company, the product enables businesses to keep track of their owned and leased assets.

IBM Credit AssetNet is a LAN-based

database program that lets users access on-line data regarding equipment model numbers, lease status and terms, location and other accounting and record-keeping essentials.

The product features a built-in communications capability with an integrated electronic mail function that provides users with a direct link to IBM Credit.

A one-time licensing fee costs \$15,000.

► IBM Credit

(203) 973-5100

HMC Software, Inc. has introduced Version 4.1 of Copy Plus for D82, a product that produces image copies up to 10 times faster than the D82 Version 3 Copy Utility.

According to the Houston company, Copy Plus allows data to remain on-line for both read and update processing while copies are being made.

Users can also make backup and recovery site copies from a primary copy after it has been made and regis-

tered, the company said.

Prices start at \$13,000 for a perpetual license.

► HMC Software  
(713) 818-8800

ShowCase Corp. has announced Showcase Vista 3.0, a Windows-based client/server query tool.

According to the Rochester, Minn. company, Showcase Vista 3.0 offers functionality that allows queries to be defaulted to IBM's AS/400 batch subsystem to protect system performance and build departments' decision-support databases.

Features include scrollable cursors at the PC desktop to manage large AS/400 databases, access to System/36 Interactive Data Definition Utility-described files and enhanced formatting capabilities using the Showcase Vista 3.0 Data Viewer.

Pricing begins at \$1,500 for one concurrent user.

► Showcase  
(507) 288-5822

Baber Information Services, Inc. has announced a backup module for its integrated backup and tape management software.

According to the Irving, Texas, company, Reveal Backup can automatically group libraries by user-specified criteria and, before every backup, dynamically update lists or groups and back them up.

Libraries that do not form part of any predefined group can automatically be grouped together and backed up.

Reveal Backup is a front-end module of Reveal Backup & Media Manager, an integrated product that covers backup management, tape management, report distribution and spool file management.

The module can be used at companies that have a large number of libraries or objects as well as a dynamic environment.

Prices range from \$995 for an AS/400 Model F02 to \$76,995 for a Model F05.

► Baber Information Services  
(214) 650-0506

# Introducing the LattisSphere System. A whole new way to rule your network.

Never again will your network rule you. Now, with the introduction of SynOptics' new LattisSphere System, control returns to your domain.

The LattisSphere System is our complete family of intelligent hubs and management products, delivering an entirely new level of network control. With the addition of the new Lattis System 5000™ intelligent hub and the latest release of Optivity™ management software, the LattisSphere System gives you a complete top-to-bottom solution for managing your network.

The LattisSphere System brings hardware and software together for a whole new level of network control.

At the core of the LattisSphere family is the Lattis System 5000, the first network center hub. Combined with Optivity software, the System 5000 provides a central connection and control point from which to manage your entire enterprise. Connect Lattis System 3000™ wiring closet hubs and Lattis System 2000™ workgroup hubs to your network center, and you have the power to build and manage a brand new type of network—the structured network.

A structured network lets you support the way your organization works—no matter how your buildings

are wired. Take Optivity software, for example. Its intuitive user interface and simple drag-and-drop operation allow you to assign network devices to logical workgroups—regardless of their physical location. So you get the security of a central location to consolidate and manage key resources, with the flexibility of distributed LAN segments.

The LattisSphere System is modular, too—buy just what you need now, then integrate new products later. That includes future technologies like ATM and high-speed LAN switching. So as your business

grows, you can be assured the LattisSphere System will grow with it. And always be backed by the worldwide leader in intelligent hubs.

To learn more about the LattisSphere System, call 1-800-FRO-NTWK, ext. 41 or return the attached card. And see how total control can finally reign.

# EDA/SQL. The Standard In Client/Server Computing.

## The Unique Middleware Solution For Accessing Any Data Anywhere.

EDA/SQL from Information Builders has become the standard for data access across all platforms, within any enterprise-wide client/server architecture.

Because no other middleware product can match the transparency and language consistency of EDA/SQL as a gateway to Sybase, Oracle, DB2 and most other major databases—even all of your legacy data. Nothing else can match EDA/SQL's compliance with DRDA, TCP/IP, ODBC and many other important protocols or its range of support for every type of network.

Which is why it's been endorsed by every major vendor in the business, from IBM to Microsoft, and is the middleware of choice for the vast majority of Fortune 1000 companies.

### DESKTOP TO DATA WITH ZERO PLATFORM DEPENDENCE

Unlike other middleware products EDA/SQL isn't dependent on a single proprietary architecture. Any user, whether they're on a corporate LAN or connected to a departmental server, can get to any authorized data, wherever it resides.

From simple ad-hoc queries to OLTP transactions, EDA/SQL's scalability guarantees platform independence. And its flexibility lets you work in SQL-based applications using data from any database, relational or non-relational.

### HOW, AND WHY, EDA/SQL CAN GET THE DATA OTHERS CAN'T

EDA/SQL includes a complete suite of data management services, interfaces, and

tools for accessing and managing data within any client/server architecture.

No other middleware product can get to, analyze, and scrub imperfect data like EDA/SQL so it can be delivered to any DBMS engine, rightsized for any platform, and made accessible from any remote location.

In fact, only EDA/SQL gives you a combination of real-time cost management, user profile control, and a custom approach to data access.

For more information on how EDA/SQL can maximize the effectiveness of your client/server environment, or to attend a FREE Seminar...

## Liant tool smooths PL/I move to Unix

By Melinda-Carol Ballou

Liant Software Corp. recently released tools designed to migrate mainframe-oriented PL/I programs to Unix and other platforms. The company is targeting the corporate organizations that created applications—and now need to rehost them—in what was once promoted as IBM's language of choice.

Open PL/I is a Unix tool set for PL/I applications that enables developers to offload PL/I software from mainframes to Unix hosts, company officials said. It also allows for migration to Unix of PL/I applications residing on Digital Equipment Corp., Wang Laboratories, Inc., Data General Corp. and ComputerVision, Inc. platforms.

"The low-hanging fruit that most of the reengineering tool vendors have gone after is the Cobol market...but because of [IBM's earlier push and] the complexity of PL/I, many of those [PL/I] applications are mission-critical, and users need an option," said Bob Lapides, a general manager for languages at Framingham, Mass.-based Liant.

"The [PL/I] users, it's significant to have an option that allows them to rehost their application," said Wayne Eckerson, an analyst at Patricia Seybold

Source: International Data Corp., Framingham, Mass.

Group, a Boston consulting firm.

Open PL/I includes a PL/I compiler, a macro preprocessor and a debugger. It is available on Unix-based Hewlett-Packard and Co., IBM, Sun Microsystems, Inc. and Intel Corp. i486 and Pentium systems.

### Sea and planets

The Jet Propulsion Laboratory in Pasadena, Calif., for instance, is using Open

### Long time running

PL/I was created during the 1950s by IBM and positioned as IBM's programming language of choice during the '70s and '80s. Approximately 20% of existing mainframe sites currently run PL/I applications, according to industry analysts, compared with about 60% running Cobol.

PL/I to migrate legacy PL/I applications from a Digital VAX/VMS host to Sun SparcStations. One of those applications was written more than 10 years ago and is being used by a "solid, established base of internal customers" to handle deep space flight predictions for the Voyager spacecraft, according to D. J. Byrne, a member of the technical staff at the lab.

Voyager was launched in 1977 and is now beyond the orbit of the planet Neptune. In addition, the Galileo probe was launched in 1989 and is still using PL/I software created to predict its flight path to Jupiter, Byrne added.

"The predictions for those spacecrafts

were done a long time ago, and the [ships are] still going," he said.

The lab is moving these applications to make it easier to change the software and maintain it. "It's easier to do this on a Unix workstation because there are a variety of available development tools, windowing environments and better editors," Byrne said. "Portability is another big" advantage of Unix.

### Unix unity

The rest of the lab's ground system is moving to Unix, and there's a "current push" to bring everything together on Unix platforms, he added.

Rewriting the applications without the Liant tools would have been difficult, and receiving enough funding to do so would have been very difficult.

Open PL/I is an enhanced subset of the ANSI PL/I subset and adds a list of IBM PL/I extensions such as controlled storage, initialization of anomalies and array cross sections.

A macro preprocessor available with Open PL/I lets developers maintain PL/I code before compilation to include code from external files and replace text, for instance.

Open PL/I is shipping now, priced at \$20,000 for an eight-user license.

## Partnership gives Notes integration capabilities

Tools will fill gaps in coordination between SQL, Notes databases

By Michael Vitzard

■ Gupta Corp. has turned to Brainstorm Technologies, Inc. in Cambridge, Mass., to help do the integration work needed to support Lotus Development Corp.'s Notes.

Under terms of the pact, Brainstorm will deliver SQL/Link for Lotus' Notes later this month. This kit will allow users of Gupta's SQL Windows tools to create applications that can read and update both SQL and Notes databases.

The Gupta tool will give Notes users a way to integrate robust user interfaces with Notes databases. Historically, Lotus has been faulted for not providing a user interface for Notes applications that rivals the user interfaces typically found on SQL or Microsoft Corp.'s Visual Basic applications. Later this year, Lotus will deliver its own visual programming tool.

Gupta is talking to Brainstorm about incorporating SQL/Link into SQLWindows later this year and is advising customers of its support for Brainstorm's solution today, a company spokesman said.

### Delayed adoption

For many users, the lack of integration between Notes and SQL databases has been a stumbling block. For example, Edison Parking Corp. in Newark, N.J., has been waiting for a SQL link to proceed with plans for its further adoption of Notes.

Edison, which manages 140 parking lots largely in the New York area, is waiting for a SQL link between Gupta's tools and Notes to integrate Notes systems in the field with the systems in its Newark office.

Edison currently uses Notes to keep track of the discounts its local managers offer individual businesses. With information stored in Notes, managers can compare contract data to determine whether there is a successful program in one region that could be applied in another region.

### Convenient, not critical

But while this tracking application offers approximately 60 users a convenient tool for sharing this knowledge, Notes has yet to evolve into a strategic platform at Edison, according to Keith Barrows, Edison's manager of the information center.

"At this point, it's not something we couldn't live without. It's not mission-critical, but it does save us time," Barrows said.

But Barrows said he hopes to make Notes part of Edison's current mission-critical infrastructure by year's end by adding applications that read and write to both Notes and SQL databases.

"We're a Gupta shop. When we get these tools, Notes will become mission-critical," Barrows said.

Once available, this type of capability will let Edison link the 700 to 800 documents, which contain information about the discounts local managers are offering, with a SQL database in which the company keeps the standard rates the company charges. As such, Edison will then have a tool that will allow its upper management to get a better handle on how discounts are affecting the company on a day-to-day basis, Barrows said.

### Cutting edge

However, Edison may be a company ahead of its time in this regard.

Randall Zahora, president of Workgroup Productivity Corp., a Notes reseller in Oak

Brook, Ill., said most companies have yet to realize the full potential of Notes integration with SQL databases.

Zahora said he expects remote, field-oriented applications running on Notes to be increasingly linked to SQL databases.

"Notes gives them the replication capabilities not found in the typical SQL database, and the SQL database provides the platform for doing quantitative analysis, which can then be fed back out to the field using Notes," Zahora said.

# Code generator aids multivendor shops

By Melinda-Carol Ballos

■ **Blue Sky Software Corp. is now shipping Version 5.5 of WindowsMaker Professional, a prototyping tool and code generator for Microsoft Corp.'s Windows, Win32 and Windows NT.**

WindowsMaker Professional lets developers automatically generate class libraries from Borland International, Inc.'s Object Windows Library (OWL), Microsoft Corp.'s Foundation Classes (MFC), 2.5 or ANSI C code, officials at the La Jolla, Calif.-based Blue Sky said.

Some corporate developers find this support particularly important.

"I am a die-hard Microsoft person, and a lot of the people I work with are die-hard Borland people, so I use WindowsMaker to constantly go back and forth between the MFC and OWL versions," said Larry Harris, technical manager at Quick America, a New York-based market data provider and a subsidiary of

Quick Corp. in Tokyo. "It's good to give Borland people Borland classes because they understand them," he said. "It makes everybody happy."

Using the appropriate Switch-It Code Generation Module, developers can generate C, C++, or MFC. Blue Sky officials said. Because WindowsMaker 5.5 supports a variety of languages, developers can simultaneously target Windows, Win32 and Windows NT. WindowsMaker regenerates code when users make changes and preserves the original work 100% upon regeneration, Blue Sky officials said.

This is unlike the skeleton code gener-

WindowsMaker 5.5 supports a variety of languages so developers can target different platforms simultaneously.

ators available with Microsoft's Visual C++ or Borland's C++, known as AppWizard and AppExpert, respectively, Harris said.

"When you want to create a new application, both AppWizard and AppExpert

will ask you a series of questions and generate a basic skeleton program. But if you change your mind, you have to start over again," he said. WindowsMaker, on the other hand, preserves the earlier work.

## Word processing help

In addition, Blue Sky is shipping an upgrade to its RoboHelp help authoring tool that can turn Microsoft Word 6.0 and Word 7.0 for Windows into hypertext authoring tools. RoboHelp 2.5 can also automatically convert existing documentation into a help system or a help system into documentation.

It can create hot-spot graphics by placing a bit map in a help window, marking sections of it and linking each section to a different topic interactively, company officials said.

WindowsMaker 5.5 and RoboHelp 2.5 are shipping. WindowsMaker is priced at \$195; the upgrade for current users costs \$189. RoboHelp is priced at \$489.

## MVS gains automation tool

By Gary H. Anthen  
RESTON, VA

Sterling Software, Inc. will soon unveil a product for automating MVS mainframe operations that beta users and analysts say goes a significant step beyond conventional message-driven automation tools.

Called Solve-Automation, Sterling's product is "service-driven," meaning it translates service objectives and policies into an automated response to problems. The approach improves systems availability and speeds problem resolution, beta users and analysts said.

Gartner Group, Inc. analyst Igor Sternmark said the policy management piece would enable a task, for example, to specify that lines to its branches must be up between 9 a.m. and 3 p.m. and to automatically take action if a line goes down. At other times, the system might employ different problem-resolution priorities, he said.

Solve-Automation defines system resources in terms of business functions and priorities. To do that, it defines a hierarchy of system applications, subsystems and physical and logical resources that must be available for the business function to be performed. Then it monitors how well these resources are responding to meet service objectives.

For example, an operator might see some concern for key applications such as general ledger billing and credit authorization, said Doug Bertinshaw, marketing director at Sterling's Systems Management Division in Reston, Va. "When you give red [the operator] clicks on it and drives right down the hierarchy of resources that made up that service to find out what failed," he said.

By the time the operator has done that, Solve-Automation may have automatically started recovery procedures, Bertinshaw said.

The product is driven by an object-oriented knowledge base supplied by Sterling and aug-

mented and tailored by the user. It catalogs systems resources and stores the organization's operations policy and procedures. Resources supported include started tasks, JES2/JES3, initiators, spool, batch jobs and VO devices. Support for network devices will be added later.

The knowledge base also builds up historical data so that it can, for example, predict the time it takes to recover from a failure based on prior experience.

## Resource prioritization

Beta user SwissAir in Zurich is replacing its message-driven automation tools with Solve-Automation. That will allow systems managers to interact with the airline's three mainframes at a higher level, said Richard Roemling, systems programmer. "We can now say, for example, that a given resource is only important between 7 a.m. and 6 p.m."

Roemling praised the product's ability to combine and summarize information from multiple systems. "You've got everything monitored, and everything has a desired state and an actual state," he said. "If they do not match and you're running it in the automated mode, it calls recovery. If it cannot recover, it [signals] an operator."

"I think technologically Sterling is ahead on this," Sternmark said. "The policy management piece on top is very unique. A lot of existing products grew from the bottom up; this was built from the top down."

A survey of MVS sites by Sterling revealed that just 30% have products that automate mainframe operations, Bertinshaw said. The consensus of those without automation was that the effort required to set up or develop conventional approaches exceeded the benefit derived from them, he said.

Solve-Automation sells for \$50,000 for a Group 4 IBM mainframe. Sterling said it will roll out a similar offering for Unix environments at a later date.

WorkGroup Solutions has announced FlagShip 4.3, which enables Clipper programmers to develop applications under Unix.

According to the Aurora, Colo., company, FlagShip performs as a tool to move existing Clipper applications for DOS and as a true language and database for Unix.

FlagShip provides true executable code, multitasking and multiprocessing. It can handle file systems with hundreds of gigabytes. FlagShip creates C code from Clipper code and recompiles it in Unix. It has no memory limitations or royalty or runtime fees.

Prices range from \$990 to \$5,700, depending on the hardware, operating system and number of users. Evaluation packages are available for \$290 to \$380.

► **WorkGroup Solutions**  
(303) 696-7470

Instant Information and Intel Corp. have announced the InstantCom/CAS Toolkit for multiline fax modems.

According to the Tualatin, Ore., firm, the product provides the tools and drivers developers need to create a turnkey SatisFaction application through either of two application programming interfaces (APIs): the standard DCA/Instant CAS Version 1.2 API or Instant Information's iCanFax API.

The InstantCom/CAS Toolkit can be licensed from Instant Information for \$600.

► **Instant Information**  
(503) 692-9711

VisualTools, Inc. has introduced VT-Speller, a product designed for developers of applications that support Windows.

According to the Lenexa, Kan., company, VT-Speller offers a standard spellchecking interface and 100,000-plus English language dictionary that can be integrated into a developer's new or existing application code.

It can be accessed directly by Microsoft Corp.'s Visual Basic or Visual C++ and is available as a Visual Basic Custom Control.

Features include support for additional user-specific dictionaries, support for simultaneous multiple dictionaries as well as the facilities for developers to create their own application-specific dictionaries.

► **VT-Speller costs \$99.**

► **VisualTools**  
(913) 509-4500

## Product short

**Digital Information Systems.** Mag has announced the port of Version 5.0 of InterView, Inc.'s PVCS Version Manager and PVCS Configuration Builder to the QNX operating system. PVCS Version Manager eliminates a number of security and backup problems and maintains a history of revisions to source documents. PVCS Configuration Builder is an automatic system builder that is completely integrated with PVCS Version Manager.

Cost: starts at \$500 for a one-to-four-user license of Version Manager and \$300 for Configuration Builder. Digital Information Systems, Rancho Cordova, Calif. (916) 535-7300.

# Oracle CDE.

## Build multimedia applications anywhere.

## Deploy them everywhere.

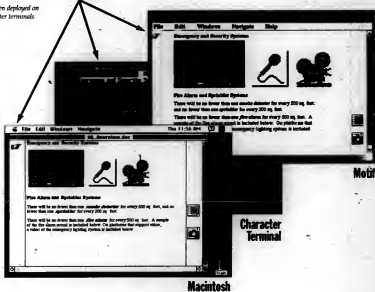

### Windows

This application was designed in Windows, then deployed on Windows, Motif, Macintosh, and even Character terminals without any programming.

"CDE's portability has been a great advantage to us, having developed the original system on UNIX we were able to port with no additional code to Microsoft Windows. It also allows us to offer the system to a much wider user base than if it had been available for only one of these environments."

Chris Nicholls  
Manager IS Dev.  
British Telecom, UK

CDE is a complete and integrated suite of application design and modeling tools that empowers system designers, programmers, and end users to cooperate in building client/server applications quickly. CDE's CASE design, development, and graphical reporting tools eliminate extensive programming to help speed and simplify your application development efforts.

Call to receive a comprehensive white paper on CDE, written by industry analyst Butler Group. 1-800-633-1071 Ext. 8124

# System formation Delivery

Available only  
in Computerworld!

"Oops - I forgot to log off again." One-size fits all 50/50 blend Cotton/Polyester. Made in U.S.A.

"Don't panic! Just push the escape key." Ceramic 16 oz Mug

"What's the digital bathroom scale doing in my laptop case?" 32 oz. Slip-it Bottle with insulator.

"What's the digital bathroom scale doing in my laptop case?" Rooney 100% natural cotton canvas with webbed straps. 14" x 9".

"Bud and Elliot Grundt develop the first Main-frame Mouse." Mousepad, 8 1/2" x 7 3/4".

"Don't panic! Just push the escape key." Durable and roomy, 16" x 9" black cotton canvas - includes sturdy webbed straps & zipper. Made in U.S.A.

# Give the gift of laughter.

What's so funny about technology?

Plenty — especially if you follow the cartoons of Rich Tennant in *Computerworld*.

The fact is, Tennant's whimsical "5th Wave" series has brought smiles to the faces of hard-working *Computerworld* readers since it first appeared in 1990.

Now we've taken some of his all-time funniest cartoons and turned them into a line of custom products that are guaranteed to delight and amuse.

Having trouble finding the right gift for a business associate who's just been promoted? Looking for an affordable birthday present for a co-worker? Need creative holiday gifts for client's in the IS industry?

*Computerworld* products are just the ticket.

You don't need a special occasion to give a *Computerworld* gift. But you do need to order right away, since supplies are limited.

Just fill out the attached form or call us at 1-800-222-7545 or fax your order to (508) 626-8258. And give the gift of laughter.

## ORDER FORM

# Management

IS managers who want to swim with sharks need first-class leadership training. But better shop around before you . . .

# HIRE EDUCATION

By  
Rochelle  
Garner

**Y**essir, you're the best. From application development to administration, you've got this information technology down pat. And you just know you're the odds-on favorite to take over the whole information systems department after the boss retires. Don't count on it. If all you've done these past eight years is become the best and the brightest in the IS group, you'll be the next injured seal in a sea of great whites. Shark bait, baby.

Here's why. To manage in today's halls of business, you must speak in net present value to Jim from Finance. And answer in terms of return on investment when the president asks why all your equipment costs so much.

But speaking the language of finance represents only part of a manager's repertoire. If you're going to swim with the sharks, you must

articulate IS issues in a way that's meaningful to those who hold your fate, understand how you can solve the problems of others in the company and motivate your subordinates to work as a team.

In other words, you must make the transition from technical virtuoso to manager and leader. Don't panic. No one expects you to make that kind of transformation on your own. You need an education on a higher plane. Good thing, then, that a host of business schools and private trainers insist they can help and are scrambling to turn your dollars into the skills you need to become a leader.

Do they guarantee your path to the executive washroom? Of course not. Nothing in life is certain. But by all accounts, the best of such programs do enhance your ability to participate

*Hire education, page 74*

**INSIDE:** Keeping the customer ecstatic at Mypro, page 80.

# Hire education

CONTINUED FROM PAGE 73

in corporate-level decisions and hone your company's business edge.

But buyer beware! Not all business schools or their programs are created equal. Many claim to produce leaders, but few have the faculty or the curricula to live up to their advertising.

That's because most MBA programs focus on the technical aspects of, say, finance, marketing and IS rather than on general management.

## Schools for functionaries

Take MBA programs. If you follow this course, you face the real danger of becoming that arrogant functionary down the hall whom nobody likes. Emphasis on the word "functionary."

MBA programs typically emphasize business analysis skills, says Frank Morgan, director of executive education at the Darden Graduate School of Business at the University of Virginia in Charlottesville.

"But to be a leader, you need to instill confidence, to listen and to communicate. Without that, you're just a technocrat."

agers or directors in a company."

So is Nemeth on a fast track to vice president? Probably not. Ohio Edison doesn't have many vice presidents and not one for technology. Still, Nemeth meets with vice presidents and senior management all the time, and today — perhaps thanks to his Program for Management Development credentials — Nemeth has a large say in Ohio Edison's new restructuring efforts.

And for sure, he glows with the pride that comes from attending one of the most prestigious executive education programs in the country. But is it one of the best? Not according to Darden's Morgan.

"In my opinion, Harvard is arguable and out of date," he says. "It has been married to the case study. And I don't think you can teach all things well when you're wedded to one type of pedagogy. No, I definitely would not include Harvard as one of the best schools for teaching leadership."

## Best of the best

Which schools would he include? His own Darden Graduate School of Business (naturally), along with the schools of business at the University of Michigan, Northwestern University and the Univer-

- 1 Check references
- 2 Sit in on a class that's under way
- 3 Read the curriculum
- 4 Ask for a list of previous students

**If you are going to swim with the sharks, you must articulate IS issues in a way that's meaningful to those who hold your fate, understand how you can solve the problems of others in the company and motivate your subordinates to work as a team. In other words, you must make the transition from technical virtuoso to manager and leader.**

erst who's good at doing tasks but who can't inspire people. And it's these critical, soft skills that most [MBA programs] don't pay attention to."

That's one reason for the high interest in executive education programs. The key benefit, a new accent on team-building, communication and — most of all — understanding the functions in a business. So from Harvard to Stanford University and parts in between, universities are attempting to teach the twenty-first century management.

## Management training

All share a boot-camp approach — students typically put in at least 12 hours a day — but vary in length from one week to more than a year.

Harvard University's Program for Management Development, for example, demands 13 weeks of total dedication. So total, in fact, that spouses must content themselves with three consecutive visits during the course.

David Nemeth, Ohio Edison Co.'s manager of IS, arrived from Akron, Ohio, for his monastic sojourn in Cambridge, Mass.

"It was exhilarating, but not so much for the lessons as for the interaction with all the other classmates," Nemeth says. "At least 40% of the students came from outside the U.S. And to be accepted, we all had to be at a certain level, like man-

agement of Pennsylvania. For one-year programs, Morgan recommends the Sloan programs at MIT and Stanford (known on the West Coast as the school with an attitude).

But give Harvard some important credit: It advertised a student body of senior-level executives, and it delivered (at least in Nemeth's class) on that promise.

Such claims do sometimes prove bogus, however.

"It's not uncommon for universities to

fill out available spots by enrolling students who fall below the executive levels their brochures advertise," says Richard Hanserhesh, managing partner at the Center for Executive Development in Cambridge, Mass.

Hanserhesh won't finger any culprits. But he does offer this advice: Ask for a list of names and titles of those who attended the last session.

"Find out if the schools are really putting in the classroom who they said will

be there," he advises. "The whole point of these programs is to learn how others at your own level deal with the same problems."

That's the agenda at the Wharton School at the University of Pennsylvania, which offers a five-week advanced management program for chief information officers and other division heads. Students live together, eat together and study together for 16 hours a day, six days a week. More than 80% of its attendees come from outside the U.S.

## The bottom line

Such a newfound outlook does not come cheaply: Prudential Insurance and Finance Services in Roseland, N.J., ponied up \$25,000 to send Senior Vice President and CIO Bill Tranter away for five weeks to an executive education program.

And is he a better manager?

"I can't tell you there is one thing I took away that I applied directly," Tranter says. "For me, the single biggest benefit I took away was the people I met, but it's useful to know that others are facing similar problems."

Obviously, we are not talking bootcamp education, but some programs are (a bit) less expensive. Hewlett-Packard Co., for example, spent about \$21,000 to send Joe Beyers (who is responsible for corporate mergers, acquisitions and

# WHAT TO WATCH FOR

## Big Savings on DECpc AXP 150 Systems

Digital is making it easier and more cost-effective than ever to purchase solutions for Windows NT running on Alpha AXP systems. Through our new Power Channel Program, we've established partnerships with software vendors to provide you with discounted, pre-optimized hardware and software configurations. Plus, you can acquire and use these solutions quickly because they come already prepackaged.

And who better than Parametric Technology Corporation (PTC) to be the first on the Power Channel bandwagon? After all, PTC's ProENGINEER software is the fastest growing Mechanical Design Automation software in the industry.

Today, through the Power Channel Program, Digital and PTC have joined together to offer you a significant price breakthrough. For a limited time only, you can get a special 40 percent discount off the price of a fully configured DECpc AXP system when you purchase a ProENGINEER license.

Tailored to meet the needs of ProENGINEER software users, this specially configured DECpc AXP 150 system — priced at only \$7,995 — is ready to plug and play, and comes equipped with everything you need to take full advantage of advanced ProENGINEER capabilities.

Purchase your ProENGINEER license by calling 817-736-9528. Then call Digital to order your specially priced and configured DECpc AXP 150 system (part number 2T-PWTC-AA). This limited-time offer is valid only with a PTC license — actual number.

## Workstation Power at a PC Price

**I**f you need more compute power than traditional PCs offer for technical and graphical applications, you'll want to hear more about a new category of technology that's emerging today. If you wish to take a giant leap forward with 21st century computing, listen to this.

It has been described as a super PC, a personal mainframe, and a RISC PC. But you can call it whatever you like. Then call Digital. Because we've got the best implementation of this new category of super technology, and we've got it now.

This new wave in computing is easy to define. For the first time in the history of the industry, you can get the industrial-strength functionality and performance of a high-end workstation with the ease of use of a PC — all at a PC price. It's Windows NT running on Digital's DECpc AXP 150 system — two technologies that have come together to offer all the characteristics of a full-strength operating system, including high reliability, security, and integrity, plus the simplicity of PC windowing.

Microsoft's Windows NT operating system gives you features like RAID support, shielded applications, and domain control for networking via easy-to-use, icon-driven software. The Alpha AXP platform is RISC technology that offers twice the floating-point performance of Pentium PCs. The system that houses both is not only a super PC — it's enabling technology

that allows more users across all industries to access an increasing number of high-performance applications.

### Performance with a Very Bright Future

Running at 150 MHz, today's DECpc Alpha AXP system boasts performance numbers that are comparable to that of a technical workstation. And that's just for starters. In fact, while Digital's competitors are nearing the end of their RISC technology performance curve, ours has only just begun.

The reason? Digital's Alpha AXP architecture incorporates

a 25-year design life. That means you can count on seeing a 200-MHz Alpha AXP PC system — 33 percent faster than today's model — introduced in the very near future. And, in time, Digital plans to deliver even higher performance systems to carry your business well into the 21st century.

**For the first time in the history of the industry, you can get the industrial-strength functionality and performance of a high-end workstation with the ease of use of a PC — all at a PC price.**

digital

## Windows NT on Alpha AXP Systems: No Competition

**We Guarantee It — Or Your Money Back**

Blaze some new trails with the mainframe power of the Windows NT operating system. How? By running it on the fastest vehicle you can get — an Alpha AXP microprocessor. Choose from a family of fast server microprocessors with performance as high as 170 SPECint, more than twice that of Pentium or PowerPC — and priced to compete. Or choose from low-cost desktop PC microprocessors with prices that start below the cost of an i486 system.

Alpha AXP microprocessors run Windows NT with thundering speed, as well as your existing DOS/Windows applications. And that's just the beginning of a long-term architecture based on a scalable RISC design and standards like the PCI local bus.

The long and short of it? Windows NT running on Alpha AXP microprocessors leaves the competition in the dust. We're certain of it. So certain that Digital is offering a 60-day money-back guarantee on all Alpha AXP workstations, Alpha AXP systems, and Alpha AXP servers. At any point within 60 days after shipment, you can return your Alpha AXP workstation, system, or server, and associated peripherals and/or software for any reason and get a full refund. All services offerings or services products are excluded.

## Step Up to the Fastest UNIX Systems in the World

### It's Easy and Affordable with Digital's Alpha AXP Upgrade Program

It's a fact. Today's compute-hungry applications are consuming workstation power at an ever-increasing pace. With users doing more work in less time, sluggish workstation and server response time can wreak havoc on business productivity. Your DECstation or DECsystem environment may need a boost in performance. And there's no time to waste.

Why not get a blast of 64-bit computing power from Digital? Now, for a limited time, you can step up to the fastest, most versatile UNIX platform in the industry — the Alpha AXP platform — for less than one-third the cost of comparable workstations and servers from Sun or Hewlett-Packard. Our one-step Upgrade Program makes it easy to double, triple, even quadruple the performance of your DECstation workstation or DECsystem server, at an incredibly affordable price.

### An Upgrade That Makes Good Business Sense

When you step up to the power of Alpha AXP, you get superior performance, flexible capacity planning, and wide open choices for future growth — all in a system that fits comfortably on your desk. Plus, you can save in three ways:

- Save big with software license credits to migrate existing software licenses, in most cases at no cost.
- Keep your current system for 60 days — free of charge — to ensure a smooth transition to Alpha AXP technology.
- Choose attractive leasing options to take advantage of Alpha AXP technology now, without tying up capital.

What's more, many of your DECstation or DECsystem components and peripherals will continue to work with your new Alpha AXP systems.

### Ordering Made Easy

Why deal with complicated part numbers and cumbersome configurations? Digital's Upgrade Program lets you choose from comprehensive upgrade packages that come complete with one easy order number. Simply pick up the phone to unleash Alpha AXP power within your computing environment for as little as \$4,295.

## TURBOCHARGE Your Sun Environment

Why wait? Gain the power and performance of Digital's Alpha AXP technology and our leadership UNIX operating system today.

If you use Sun workstations or servers, you may be pushing the performance limit of your computing environment. Now, it's easy and cost-effective to add power and new technology and retain compatibility with your existing Sun environment.

With Digital's Alpha AXP turbocharging solutions, you can enhance the speed of your critical CPU-starved applications and run your favorite SunOS and Solaris applications two, three, four, even five times faster than before. Significantly improve your I/O throughput by taking advantage of the industry's:

- Fastest NFS Servers — tripling the number of NFS clients and cutting your response time in half
  - Fastest I/O disk subsystem, with throughputs sustained at over 25 Mbytes/s
  - Best networking with FDDI at 96 Mbits/s
- Also, take advantage of Digital's distributed computing solutions to turbocharge your existing environment and utilize the full potential of all your systems.

Find out how Digital's Alpha AXP products and turbocharging solutions can benefit your business. Simply pick up the phone and request your portfolio of valuable information.

and reference code 6TM.

### For Sun Users, It's a Big Deal

Now, you can get up to \$40,000 in trade-in value on any SPARC workstation and the SPARC servers, including 4/330, 4/370, 4/390, 4/470, 4/490, 6/30, 6/70, and 6/90. Digital has pursued aggressive pricing on all upgrades to Alpha AXP work-

stations and servers if you trade in your Sun equipment today. In fact, you get 1.5 to 3 times the performance of your SPARC system at half the price. And if you're an existing Digital customer, you get 20 percent off your net price of all Alpha AXP systems listed below.

#### Sun Trade-in Program for New Customers

Alpha AXP Workstation Purchase	Trade-In Allowance	Alpha AXP Server Purchase	Trade-In Allowance
DEC 3000 Model 300		DEC 3000 Model 600S	
PE301-BA/BB/BC	\$1,500	PE430-AA/BA/CA/DA	\$3,600

## Hire education

CONTINUED FROM PAGE 74

strategic alliances) to Darden's six-week Executive Program.

Like its Wharton counterpart, The Executive Program focuses on interaction and team dynamics. Such skills did not come naturally to Beyers, who rose from research and development to become

versities are your only educational venue. Private organizations provide a quick (but not easy) way to give company executives some leadership veneer.

At the Center for Creative Leadership in Greensboro, N.C., students spend a more 5½ days learning the ropes of team-building, decision-making and personality interpretation. And the center goes after IS professionals in a big way with its Leadership for Technical Managers course. This is possibly the only such

ter permits only one student per company per class. Cost per student: \$3,100.

This go-it-alone approach probably wouldn't make sense to the Center for Executive Development's Hamermesh.

Done right, in-house programs become forums for IS executives to hear what managers of other business units expect," Hamermesh says. "And when you put the different functions together, those managers can better address the issues that their company faces."

curriculum development.

Before passing that item from past the chief financial officer, ask the smartest company. First, check references. Next, sit in on a class that's under way. And third, read the curriculum. If it telegraphs the firm's business— even when you have no idea who the customer is— you've spotted a well-customized curriculum.

And be aware that sometimes these courses can have unanticipated results. The boot-camp education, many graduates say, has opened their eyes to new career possibilities.

"The program I took [at Case Western Reserve University] has definitely improved my ability to understand how IS fits into the organization," says Linda George, director of IS at Grand Corp Automotive in Parkersburg, Ohio.

"But now I'm not so sure that becoming a corporate CIO is the career path I want to follow; especially since I think that big title sets you up as a target," George adds. "Time, you're better off being seen as a business contributor, in a small unit, where you can demonstrate the benefits of your informal IS strategy."

Share these programs without the expense? Some are, some aren't. Just remember, it's as easy to spend \$20,000 for a poor program as for a good one.

*George is a free-lance writer in San Carlos, Calif.*

**"To be a leader, you need to instill confidence, to listen and to communicate. Without that, you're just a technocrat who's good at doing tasks but who can't inspire people. And it's these critical, soft skills that most [MBA programs] don't pay attention to."** Frank Morgan, University of Virginia

manager of business development at HP.

"From Darden, I realize that a team concept is more than putting together a task force," says Darden, who co-edited HP's recent alliance with Apple Computer, Inc., IBM and Taligent, Inc. "How you position your comments, how you make assignments, how you recognize the contributions that the team members have made— that's all part of the team process."

But don't get the impression that uni-

versities are your only educational venue. Private organizations provide a quick (but not easy) way to give company executives some leadership veneer.

At the Center for Creative Leadership in Greensboro, N.C., students spend a more 5½ days learning the ropes of team-building, decision-making and personality interpretation. And the center goes after IS professionals in a big way with its Leadership for Technical Managers course. This is possibly the only such

program that uses computer simulation as a major training tool.

"Students make decisions as a group, and the simulation then sees the impact of their decisions immediately," explains David Hirth, senior program associate at the center. "We then watch what they do and how they did it."

Throw in a spin of the videotape? "Now, Fred, this is where you lacked confidence with that comment," and you, too, can become a skilled team-builder. The cen-

While the curriculum depends on the client, there's the familiar emphasis on teamwork, financial skills for financial managers, listening and communicating. And because it's not by the by of academia, the center often reports to professional actors who teach attendees the art of expression.

If that sounds appealing, know this: Five-day, customized courses for 30 students cost about \$75,000, not including the cost of room and board and upfront

## Executive

### Track

**Edward N. Altman** has been appointed vice president of MIS at Metro-Goldwyn-Mayer, Inc. (MGM) in Santa Monica, Calif. He succeeds John Sanders, who has been appointed head of information systems at Republic/Spelling Productions. Altman will report to Executive Vice President Michael S. Hops.

He will be responsible for all IS duties at MGM, including MGM and United Artists motion picture productions, home video productions and worldwide distribution.

Altman said he is part of a new management team that MGM is bringing in to rebuild the lagging studio, with the intent to sell it in three years. "Toward that goal, the studio is boosting its inventory of film productions to better position itself against industry leaders such as Warner Bros. Inc.

"MGM is fairly down right now," he said, "but we're building up a backlog of movies" for spring release.

Prior to his appointment, Altman was executive director of IS at Paramount Pictures Corp., where he was responsible for all systems support for the motion picture, studio and finance units.

Altman previously served as executive director of systems and programming at

## Twentieth Century-Fox Film Corp.

**Carl C. Williams, 56**, has been elected vice president of information technology at Amoco Corp. in Chicago. He replaces John R. Reid, who has been named vice president and controller at Amoco.

Williams' duties will include the overall direction and deployment of information technology services throughout the corporation, as well as the direct management of the information technology department. He joined Amoco in September 1983 as general manager of computing networks and operations.

Prior to that, Williams was vice president of information systems and technology at Macmillan Publishing Co. and senior vice president at DDB Needham Worldwide.

**Levi Strauss North America** in San Francisco, a division of Levi Strauss & Co., has announced the appointment of

**Joseph K. Johnson** as director of computing and communications services. He will manage the division's information services center and its move to the Dallas area. From San Francisco this summer Johnson will report to Rich Lasser, vice president of Levi Strauss North America's information resources department.

Prior to joining Levi Strauss North

America, Johnson was at Electronic Data Systems Corp. in Plano, Texas, where he served for the past 12 years in various positions. Most recently, he provided operational, technical and business consulting to senior management at the distribution service center.

**Brad S. Stout, 50**, has been appointed chief information officer at Tibtech Corp. in Ogden, Utah. He will be responsible for all computer, telecommunications and information systems functions as in the company.

Stout joined Tibtech in 1981 as director of IS. Prior to that, he was director of management information services at Bell Aerospace Texttron/Division of Texttron, Inc. in Buffalo, N.Y.

**Justin Yaros** has been named MCA, Inc.'s corporate information services as director of music entertainment group information services.

He will be responsible for the development and maintenance of all computer and information applications supporting the MCA Music/Entertainment Group, which includes MCA Records and 18 other MCA record labels, UNI Distribution Corp., MCA Music Publishing, MCA Concerts, Flechtly Merchandising and Wineland Productions.

Yaros will report to George Brenner, director of corporate information services at MCA. Prior to joining the company, he was executive director and chief information officer of information systems at Republic Pictures.

**Software Spectrum** in Dallas has appointed **Robert B. Mercer** vice president and chief information officer. Prior to joining Software Spectrum, he was vice president in CBI at Lecters, Inc., which is a specialty retailer based in New Jersey.

**Meg Williams** has been promoted to vice president of information systems at Highlights For Children, Inc. in Columbus, Ohio, the nation's largest

subscription children's publication. Williams was previously director of IS applications in her new position. She will handle all computer-related activities at Highlights and will supervise a staff of 75 employees. Williams has been at Highlights since 1988.

**Mays Nakashima** has been appointed chief information officer at System Management Systems Corp. in Lanham, Md. He will be responsible for enhancing and creating critical internal information systems for accounting, distribution, desktop platforms, networks and servers. Prior to joining Bystron, Nakashima was manager of IS at Palco Microsystems in Landover, Md.

# Keeping the customer ecstatic

*Sharing internal manufacturing process data is one way Nypro delights its quality-conscious customers*

By Alan R. Earls

**N**ypro, Inc., a precision injection molder in the sleepy mill town of Clinton, Mass., has won a national reputation in manufacturing circles as a supplier that large, quality-conscious companies can rely on.

When Gillette Co. released the Lady Sensor razor, it contracted for the first time with an outsider to manufacture its razors. Millions of Lady Sensors later, the Boston-based personal care products giant remains wedded to Nypro.

Johnson & Johnson's Vistakon unit, the market leader in contact lenses, also relies on Nypro for key stages in its manufacture of contact lens blanks. Nypro has shipped more than 2 billion parts to Vistakon without missing a delivery date and with no defects, according to Brian Jones, Nypro's corporate vice president for quality.

Nypro has tripled sales — to the \$200 million level — in just six years, while trimming its customer base from more than 600 customers to just 30.

## An open book

The key to Nypro's success lies in selecting and staying close to a particular kind of customer: one that produces high volumes of exceptionally high-quality products. Information systems has been the enabler. Most of Nypro's customers are health care and high technology firms. (Other clients include floppy disk maker Verbatim Corp. in Charlotte, N.C., and pharmaceutical giants such as Abbott Laboratories.)

Nypro accomplishes this by sharing manufacturing process information with its customers and organizing itself into small business units that focus on the needs of a single customer. Joint management teams, with customer and supplier sharing manufacturing responsibility, have also helped Nypro succeed.

Nypro's relationship with Vistakon is a good example of how IS helps the two companies share information and management oversight. To meet Vistakon's demands for quality, the companies established a joint management team.

The team decided it was critical for Vistakon to obtain manufacturing process control information so it could instantly modify the manufacturing processes at Nypro if anything was not up to standard. Because of Nypro's IS infrastructure, the company not only knew the quality of the products instantaneously but was also aware of what was being done in the process, Jones explains.

For example, Vistakon could correlate tiny variations in temperature or voltage at Nypro's injection molders with the quality of finished Acuvue contact lenses

Nypro's Dan Gorman: Company took steps to free itself from data management to spend more time manufacturing plastics

coming out of Vistakon's Jacksonville, Fla., plant.

Nypro has spent six years building up its enabling IS infrastructure. "When we started this process six years ago, we had a very traditional setup for a small manufacturer, with a System/38 and 38 for handling the business side," explains Dan Gorman, manager of corporate network technology at Nypro.

It soon became clear, however, that even the most skilled production workers would have trouble meeting the new quality goals unaided. Workers could not see only after the fact to defects and had to guess at what adjustments should be made to correct them. So new process control computers were installed and linked to a server — an IBM AS/400 at the first company site in Puerto Rico.

The servers collected operational information and managed the work of individual machines while the controllers applied statistical process control techniques to produce advisories for workers on the shop floor. The process controllers reduced the guesswork.

The next step, brought about by relationships such as the one with Vistakon, was to make real-time process control data available not within Nypro but to its customers. Customers would have access to the servers and be better able to see what was happening in the production process and what steps were being taken to maintain quality control.

To do this, Nypro set up a wide-area network. Instead of dedicating joint monthly management team meetings to roam through reams of production and de-

fect data — and then waiting to implement needed changes — managers at both firms could now tweak the process day by day and hour by hour.

"Our users loved it, but they got spoiled. They wanted something even easier," Jones says.

After more tweaking of the system, users can now get summary data that concerns them when they log on each day.

Nypro's ability to open up its internal processes to demanding customers, coupled with its joint management team approach, has won it the praise of management guru Tom Peters. "Nypro defines what's possible in customer partnering," he writes in his newsletter, "On Achieving Excellence."

Earls is a free-lance writer in Arlington, Mass.

## European outsourcing raves

The European outsourcing market will more than double during the next four years to reach an estimated worth of \$16.1 million (U.S. equivalent).

That is the latest prediction from "Computing Services Markets Europe," an information service of Ovum Ltd. in London.

Outsourcing is gaining in popularity for three reasons:

1. Financial, as economic conditions in most European countries are putting pressure on companies to downsize and reduce their information systems spending. Outsourcing is seen as a way to do this.

2. Management mind-set, as many IS managers are refocusing on core business functions and outsourcing not only computing functions but also entire business functions.

3. Control, as European IS departments continue to operate under a poor reputation for meeting budgets and deadlines.

The three top American outsourcing suppliers to European markets in 1996 were Electronic Data Systems Corp., which ranked top overall among all outsourcing suppliers in Europe, with outsourcing revenue of \$491 million (U.S. equivalent); Digital Equipment Corp., which was No. 2 overall, with outsourcing revenue of \$353 million (U.S. equivalent); and IBM, which was No. 3 overall, with outsourcing revenue of \$109 million (U.S. equivalent).

## Exploring the global village

Have you ever seen the American Express Co. television commercial in which Toys R Us, Inc. Chairman and Chief Executive Officer Charles Lazarus dotes on the similarities in buying patterns of parents and children in Tokyo and their counterparts in Frankfurt and London?

As it turns out, Paris consumers have a lot more in common with customers in New York than Manhattanites do with their neighbors in Brooklyn or Staten Island.

These cultural differences and similarities are just a handful of the conclusions reached in a recent book on corporate expansionism titled *Global*

*Vision: Building New Models for the Corporation of the Future*.

*Global Vision*, which was penned by IBM Consulting Group Vice President John L. Daniels and his wife, Caroline, a researcher at the London Business School, is based on a five-year worldwide study jointly conducted by IBM and KPMG Peat Marwick of companies striving to globalize.

High on the list of necessary requirements and remains competitive, they say, is the use of information technology to attain a competitive global advantage.

Of course, this road is fraught with risks—globalizing a corporate information technology infrastructure is an expensive and long-term commitment. But as the Daniels pointed out, companies with a successful global plan are usually those that have forged strategic alliances with partners.

Case in point: Rosenbluth Travel Agency in Philadelphia used savvy partnerships and a skillful dose of information technology to move from third quadruple revenue between 1990 and 1991, applying it to \$3 billion.

Source: *Global Vision: Building New Models for the Corporation of the Future*, McGraw Hill, Inc., 1995

## Managing mainframe maintenance madness

Like a new parent saddled with caring for an infant alone, information systems managers are finding themselves overwhelmed by their legacy systems and the need for care and attention. So much so, in fact, that they never have enough time or energy left for the other off-spring requiring attention.

According to a recent report from Forrester Research Inc. in Cambridge, Mass., IS executives revealed that nearly half of their department's manpower goes to simply maintaining host-based systems. The majority of those same 51 managers, all from Fortune 500 companies, said

they feel that picture will not change in the immediate future.

But if companies are to take advantage of cutting-edge technologies and remain competitive, they must break through this mainframe maintenance madness, according to Forrester senior analyst Donald A. DePalma.

Obviously IS managers can't throw the baby out with the bathwater, but DePalma said they should start a deliberate migration away from these inflexible systems. He suggested large companies look at a five-to-seven-year project to "rehabilitate, re-host or rebuild" their legacy systems.

The journey, which DePalma stressed "will not be painless," should have three distinct stages:

1. Embarkation, "during which accounts evaluate their legacy profiles, push easy-to-move applications off the host and open old-world data sources."

2. Transition, "in which companies use client/server versions of mainframe technologies such as CICS and CA-IDS to rehost legacy systems to Unix."

3. Discovery, in which "MIS organizations completely overhaul host-based systems for client/server."

DePalma also said companies will have to rely on a combination of resources to make the journey successful, including internal resources, software suppliers and outsourcing.

➤ Freightliner Corporation is known for building some of the world's most reliable heavy-duty trucks. Which is why they just don't tolerate breakdowns. So when their existing service support computer system needed replacement, they wasted no time in looking for someone to help them with the overhaul. After all, no one wants to tell a sidelined truckdriver there's a computer delay. ➤

*Rob Havell*  
*Computerworld Reader*  
*Since 1968*  
*General Manager, MIS*  
*Freightliner Corporation*

*In the information market, this much is clear: Vendors make the products. IS managers make the decisions.*

*And no one is better suited to bring them together than we are. Another match made by Computerworld.*

Steve Ballmer  
Computerworld Advertiser  
Since 1987  
Executive Vice President  
Worldwide Sales & Support  
Microsoft Corporation

➤ When the dust settled, Microsoft was in the driver's seat. Freightliner's ServicePro server, running Microsoft Windows NT, allowed Freightliner dealers to generate repair orders, diagnose truck problems and access any relevant information. All while leveraging the dealers' existing parts and service applications. Did Microsoft make an impact on Freightliner's new system? That's a big ten-four. ➤

# ARE WE JUST PLAIN LAZY?

**It is easier (and cheaper) to buy the latest, greatest software or system than to train users to maximize the systems they have. Many IS chiefs are taking the easy way out.**

**W**e don't need, and certainly don't know how to use, 90% of the personal computing power sitting on our desks. Yet we continue to upgrade hardware and software as each new release becomes available.

Technology has become the panacea for all that ails us, and we have become addicted to the potion. Like any addictive substance, it prevents us from thinking clearly about our actions. Like certain drugs, it has become fashionable. Technology has become a status symbol.

If you don't have the latest piece of hardware shuddering on your desk like a rocket straining for the skies at liftoff or the latest version of the snazzy graphical user interface (GUI) absorbing all the power your PC can deliver, then you are a technodweeb.

The best indication of this trend is the lemming-like behavior of the market whenever a new software release arrives. Most users do not need the latest word processor, operating system, GUI, database or spreadsheet. Versions that were available three, four or even five years ago meet the day-to-day needs of most users.

This raises the central question regarding the use of any technology in a business organization: Why is it there?

There are only two reasons to use a computer at work—to be more efficient or to be more effective. Our objective as managers of the tech-

Lazy, page 86

**IN MY  
VIEW**  
BY PETER  
DE JAGER

## Lazy

CONTINUED FROM PAGE 58

nology is to deliver effectiveness and of efficiency as "efficiently as possible." We are obligated to deliver the maximum amount of productivity at minimum cost. But do? Consider for a moment the following experience I encountered.

A clerk in a financial institution was working with a DOS-based spreadsheet on a 286 PC. The large amount of data keyed into the computer needed to conform to specific business rules. For example, all negative amounts had to be replaced by a zero.

The clerk spent three weeks creating a large macro that examined each data cell and inserted zeros where appropriate. Unfortunately, the solution pushed the spreadsheet to an ill-defined limit, generating the error message "too many nested ifs."

The clerk called a computer person to the scene, who found that the user had created a macro more than 60 pages in length, mostly a series of if-then-else statements. This user was not lazy. He spent a great deal of time and effort writing a macro to implement a business rule. It just so happened the user did not know the correct method.

The computer person created a new section in the spreadsheet and used a built-in function to examine the individual cells, creating a modified data set. Using the copy command, this took less than five minutes. And the solution was not destructive to the data, so even if the business rules changed, the original negative data would still be available.

The cost of ignorance in this situation was three weeks of wasted effort.

## Nature of the beast

This incident raises two important issues. The first stems from human nature. Once you believe you know how to do something, you ask for help only when you run into trouble, not before. If the clerk had completed the macro on page 58, he would not have contacted the computer person. The clerk would never have needed help. The 56-page macro would still be running today.

To answer the question "Do PCs increase productivity?" we must know how they are being used. As the manager concerned with questions of productivity in your organization, do you know how your PCs are being used? Are your users more productive? How many 56-page macros exist on your PCs? How many users at this very moment are implementing solutions that will take weeks of effort instead of minutes?

The second issue is the macro and its relationship in productivity. How much

## CIO REACTION

JOYCE

At BlueCross/BlueShield of Massachusetts, we are working hard to avoid the "knee-jerk" up grade syndrome I saw many other companies fall prey to during my years in a consulting post at General Electric and Lybrand.

I work in a company that has 6,000 employees charged with providing excellent services at ever decreasing cost. We cannot buy the new toy that comes on the market or automatically upgrade to new releases. Decisions to buy, upgrade or replace software and hardware must be justified by clear requirements for functionality, capacity, ease of service, cost and compatibility (networking and interoperability).

For each acquisition or upgrade, we schedule appropriate training to coincide with installation. We are evolving our training curriculum to incorporate pre- and post-training proficiency measurement. Our commitment is to disciplined buying and timely training.

—Martin V. Joyce Jr., executive vice president, client services group, BlueCross/BlueShield of Massachusetts

HIRT

The situation is not as black and white as "buy vs. upgrade." There are good reasons for upgrading hardware or software. New software may have better features. New hardware may be faster.

For example, in client/server — mean you may get more productivity with a smaller machine. The CFO, CEO and I have wrestled with the issue of software upgrades. We have decided to re-evaluate software quarterly to ensure our recommended in-house

packages continue to be the right choices. If it makes sense to change entire applications, we do so and make an investment in training.

It's not just the cost of new software or just the cost of training. It's the time it takes for users to go from being neophytes to being as proficient as they were on the old system.

—Lawrence Runge, chief information officer, Altek, Inc.

Upgrading software is a tricky issue. In our highly networked environment, a single critical upgrade of a key product can trigger many related upgrades to keep the operation in sync. Plus, software companies create tremendous public pressure to use their newest products. Users expect it to be on top of the most current products.

We push responsibility out to line managers. It does provide extensive training through an outside group at no cost to the operating units. But it can't mandate that people go to training. The responsibility for increased productivity, or success, ultimately resides with line management.

—Andy Cobb, head of information systems, American Chemical Society

HIRT

Our philosophy about upgrades or training is this: On mission-critical systems, we stay current with new releases of software or database software. We upgrade computer hardware in required increments of performance needs. For productivity software, such as spreadsheets and word processing, we give end users what they are comfortable with, and we upgrade when new releases seem valuable.

When a situation arises in which we may need to make a change — to make the people more productive — we re-evaluate the application and see if retraining is necessary.

—Gene Hart, vice president, information systems, Home Office Reference Laboratories

Interviews conducted by free-lance writer Emily Leidos.

more "productive" will the clerk become when you upgrade the machine from a 286 to a Pentium running the latest GUI and appropriate GUI applications?

There is no doubt the clerk will be more productive — the macro will run faster. So what? It will take a long time to offset those lost weeks of programming.

If the goal is maximum productivity at the lowest cost, then a day of training usually delivers more productivity per dollar than costly hardware and software upgrades.

In my little tale from real life, the user did not receive the necessary training to use very powerful and sophisticated tools. In this organization, upgrading from one release to the next in search of productivity is standard operating procedure. In this organization, management believes strongly in the myth of "user-friendly" and skips on training.

The problem is two-fold. On the one hand, training is difficult. It requires talent to train people to use tools properly. It is impossible to convince people that training has had an effect once the training has taken place.

It is more difficult, in terms of delivery,

to train corporate spreadsheet users to use their applications more effectively than it is to upgrade the corporate spreadsheet in the vain hope of achieving a productivity increase.

Upgrading technology, on the other hand, is relatively simple. All it takes is money, and you can upgrade until the vendors run out of product. To prove you have had an effect, all you need do is point to the hundreds of empty boxes and unopened shrink-wrapped manuals.

So, given the choice between two tasks, one difficult and hard to justify the other easy and simple to prove, which one would you choose?

## We're oblivious

The marketplace has spoken several times on this issue. We upgrade, oblivious to the fact that training is the better solution if our objective is to deliver cost-effective productivity.

It is possible to create an objective productivity improvement strategy. It requires shifting focus away from solutions and concentrating on needs.

The starting point for improving productivity is a needs analysis. You need to know what people can and cannot do with the tools they already possess. This information must be gathered in two ways: observation and interrogation.

Through interrogation, your users will tell what they are doing and what they would like to do. Interrogation will prod your users to ask the question: "Can I

move from one application to the other?"

Your observations will tell you what they are doing and what they don't know how to do. Observation will expose users abusing the technology and their valuable time and resources.

Both strategies are required to achieve an accurate picture of productivity levels. Once you know where you are, you can start planning for where you want to be. You can achieve productivity increases by training people to use specific features of existing products or by doing things differently.

You can also achieve increases in productivity by buying the specific capabilities (in the form of upgrades) necessary to complete a task. It does not matter to state specifically those features that will "force" you to perform your next upgrade. You then sit back and wait for the vendors to deliver.

In the search for productivity, strategies, upgrades and training are valid if, and only if, they are done to achieve specific predetermined goals. Upgrading because everyone else is or because you saw the product at Comdex are not sufficient reasons. Unless, of course, you are working for the last remaining corporation with money to burn.

De-Jager is an industry speaker on topics of change, creativity and management technology and can be reached at (415) 772-6706. He is a former information center manager.

**Don't buy into the 'user-friendly' myth**

## AUTOMATIC SPEECH RECOGNITION

## Can you cope?

By Don Burleson

Automatic speech recognition (ASR) is intended to allow a computer system to understand anyone who speaks to it, regardless of what they say. Although it has not yet fulfilled expectations, it is generating a lot of interest, and programmers should prepare to meet its challenges.

New ASR products have built-in vocabularies, but the association of words to events, such as "display the order for the customer," are done by programmers.

From the user's perspective, voice programs appear easy to use. ModTalk, an ASR product from Kol Vox, Inc. in Toronto, for instance, allows complex patient scheduling and records management to be performed with a voice. A physician can simply state a patient's name, which in turn invokes a procedure that extracts records from a database and allows him to verbally append the information.

But despite the simplicity, a great deal of sophisticated programming lies behind this interface. "ASR programs use task-driven interface to the computer, but programmers need an entirely new skill set to create user-friendly systems," says Dan Thompson, co-founder of Kol Vox.

A voice interface is similar to the macro definition facility within Windows. When the macro recorder is turned on, all subsequent keystrokes are recorded.

The programmer "names" the keystroke sequence, usually to a function key. When the function key is hit, the keystrokes are executed.

Voice interfaces work in much the same way. A programmer determines the keystroke sequence and defines them to the voice interface by assigning the sequence to an utterance (a spoken word or phrase). When that particular word is spoken, the keystrokes are executed.

Newer ASR systems are being developed for industry-specific applications, but many do not require programming. They simply plug and play. More general products, such as Dragon Systems, Inc.'s DragonDictate and IBM's VoiceType 2, however, can be customized, allowing programmers to create custom voice interfaces for different applications.

Other products such as voice macro tools provide an interface to voice systems and are used to associate phrases with events such as "open window" and "close document."

The biggest challenge for programmers is when voice macros are parameterized. A parameter is a key word that is expected to influence the sequence of events. For ex-

## Programmers must learn to create user-friendly voice interfaces.

ample, the Print utterance can have a file name parameter, so when Print Mydoc is uttered, the system takes the Mydoc file and directs it to an output device.

Polymorphic parameters are especially intricate. Polymorphism occurs when a word is modified by another word and creates a function change. For example, a Print utterance will invoke different procedures depending upon the destination of the print job. Print to Fax will have a very different behavior than the Print to Printer utterance.

Synonyms are also problematic. A

good implementation of ASR should include all utterances that possess a common meaning. For example, the Exit function should be associated with the utterances of Clear, Leave, Bye and Close. Programmers must learn to program for this ambiguity.

Despite these difficulties, experts predict that programmers will eventually be able to create ASR front ends for databases that accept user slang and shorthand. In the long term, ASR technology will eventually improve the speed and the efficiency of operations and make some tasks easier. It is only a matter of time before more companies jump on the bandwagon.

Burleson is a database administrator and author of *Practical Application of Object-oriented Techniques for Relational Databases*. He also teaches information systems at a local university.

## Cities of Fortune

If you're looking for a great place to work, you can't do better than CTG. Not only are we one of the nation's largest integrated professional services and information technology consulting firms, we also have openings in most of *Entrepreneur's* Top Ten Cities for Knowledge Workers. All told, we have 65 offices in 13 countries and count among our clients, 85 of the Fortune 100.

Apply for one of our current national openings for: **Programmer Analysts, Systems Programmers, Software Engineers/Consultants, Telecommunications/Database Specialists and Technical Teleoperators.** Technical positions require experience in one or more of the following skill sets:

APL, APL/PC, C++, CICS, ClientServer, COBOL, CSE, DB2, DLI, IMS, IMS, DB2/PC, Ingres, JES2, JES3, Model 204, MVS, Novell Client, Oracle, OS/2, PowerBuilder, REXX, RPG, SAP, SMS, software testing, SQL, Sybase, UNIX, VAX, VME, VAXC/DB2, VME, Windows.

See how fortunate can favor you. Send your resume to: CTG, 800 Delaware Ave., Dept. JHCW0214, Buffalo, NY 14203. Or FAX to 716/887-7436. Equal Opportunity Employer M/F/V/D. We are not an employment agency.

## CLIENT/SERVER DEVELOPMENT

DSC is hiring for long term projects now! Development experience and a commitment of several years are required. We are seeking: UNIX, POWERPC/RS/6000, and STRAS. If you have a strong desire to achieve in a service oriented company, or are an independent or full time basis, we would like to talk to you!

• UNIX • C/C++ • INFORMIX  
• INGRES • POWERPC/RS/6000 • STRAS  
• WINDOWS • ORACLE • TPC/TP  
• VISUAL BASIC • OBJECTIVE • AIX

Competitive salaries and benefits.  
For more information fax or send your resume to:

**DESIGN SYNERGY CORPORATION**  
1077 Central Street, Box 2, Suite 100  
Cincinnati, Ohio 45202  
Fax: 513/721-8444

Our openings are immediate!

**PORTLAND, OREGON**  
Seeking a programmatic team. We are seeking a team of experienced software developers, system analysts, and project managers. The team will be responsible for the development and implementation of a new client/server system. The team will be working on a project that is expected to last for at least 3 years. We are interested in people who are self-motivated, have a strong background in client/server development, and are willing to work in a fast-paced environment. Please send your resume to: **Client/Server**, 1077 Central Street, Box 2, Suite 100, Cincinnati, Ohio 45202.

**Applications:**  
Send resume to: **Client/Server**, 1077 Central Street, Box 2, Suite 100, Cincinnati, Ohio 45202. Fax: 513/721-8444.

**Interview:**  
Send resume to: **Client/Server**, 1077 Central Street, Box 2, Suite 100, Cincinnati, Ohio 45202. Fax: 513/721-8444.

## INFORMATION SYSTEMS FACULTY POSITIONS

Purdue University's Department of Computer Technology Institute is seeking for Information Systems Professor positions at its West Lafayette, Indiana campus. The positions are open for teaching and research in the areas of:

1. Database Systems, 2. Expert Systems, 3. Artificial Intelligence, 4. Systems Analysis, 5. Software Engineering, 6. Information Systems Management, 7. Systems Security, 8. Systems Integration, 9. Systems Evaluation, 10. Systems Design, 11. Systems Implementation, 12. Systems Maintenance, 13. Systems Support, 14. Systems Training, 15. Systems Development, 16. Systems Testing, 17. Systems Deployment, 18. Systems Operation, 19. Systems Administration, 20. Systems Management.

For full consideration, a completed Purdue Degree in a computer-related field is required. At least three years of graduate research or teaching experience in the above areas is required. Please send your resume to: **Information Systems Faculty Positions**, Purdue University, Department of Computer Technology Institute, West Lafayette, Indiana 47907-1301. For information only, contact Prof. William A. Dittman at 513/721-8444.

Purdue University is an equal opportunity, affirmative action employer.

L&F

The Southeast recruiting market is hot and so is CASE. We are looking for experienced CASE professionals to join our team. We are currently seeking individuals with 5-10 years of experience in the following areas: CASE Analysis, CASE Design, CASE Implementation, CASE Maintenance, CASE Support, CASE Training, CASE Development, CASE Testing, CASE Deployment, CASE Operation, CASE Administration, CASE Management.

Successful candidates will develop solid relationships with clients and will be responsible for the successful implementation of CASE projects. We are looking for individuals who are self-motivated, have a strong background in CASE, and are willing to work in a fast-paced environment. Please send your resume to: **CASE Professionals**, 1077 Central Street, Box 2, Suite 100, Cincinnati, Ohio 45202.

**Applications:**  
Send resume to: **CASE Professionals**, 1077 Central Street, Box 2, Suite 100, Cincinnati, Ohio 45202. Fax: 513/721-8444.

**Interview:**  
Send resume to: **CASE Professionals**, 1077 Central Street, Box 2, Suite 100, Cincinnati, Ohio 45202. Fax: 513/721-8444.

**Sunbelt Consultants**  
We are looking for experienced CASE professionals to join our team. ## Computer Careers Midwest

## Because of our long-term recruitment success, we continue to place 100% of our national media advertising in one publication. Computerworld.

Stephen J. Kukoy  
President  
National Computer Associates

Stephen J. Kukoy is not only President of National Computer Associates, but also President of Abacus Consultants, Inc. in Denver. Having been in the recruitment business for nearly 15 years, he knows the critical role advertising plays in finding the best qualified professionals. He also knows where his recruitment advertising dollars are best spent.

Founded in 1971, National Computer Associates (NCA) is an exclusive group of private firms dedicated to importing and exporting computer personnel on a national basis. With an active membership of 30 firms throughout the United States, Great Britain, Canada, and Australia, NCA is virtually a network of "branch offices" working together to place the best qualified IS professionals in the right jobs. Today, NCA's aggressive growth and strategic market positioning make recruitment advertising more important than ever.

"Since Computerworld is the most respected professional newspaper for computer professionals, we believe it's our most direct means for reaching our entire target audience - programmers, systems, analysts, and IS directors ... operations, technical support, telecommunications, and PC professionals ... even vice presidents and presidents. And with its national reach, Computerworld is the perfect place to tell these IS professionals about how NCA, with its pooled resources and industry expertise, offers them a wider variety of jobs in more companies in just about every location.

"Because of our long-term recruitment success, we continue to place 100% of our national media advertising in one publication. Computerworld. Time after time, Computerworld produces top-calibre candidates - qualified professionals who are truly interested in keeping their careers abreast of the industry's rapid changes and trends.

"Looking ahead, we expect several factors to escalate our recruitment advertising needs - the growing demand by clients for greater selectivity, an increasingly specialized industry, a continually mobile marketplace, and NCA's expansion into the lucrative European marketplace. As this all happens, we intend to increase our advertising budget in Computerworld proportionately.

"Computerworld recruitment advertising has been equally successful for Abacus Consultants. Although we've experienced many such situations, one specific instance comes to mind. After local advertising proved unsuccessful for finding a particularly hard-to-find individual in the Denver area, the client gave us the go-ahead to advertise nationally. We ran one recruitment advertisement in Computerworld - and got an instant response from just the candidate we were looking for - right here in our local area. It just goes to show that Computerworld delivers far better candidates than any other source.

Computerworld. We're helping serious employers and qualified information systems, communications, and PC professionals get together in the computer community. Every week. Just ask Stephen J. Kukoy. For all the facts on how Computerworld can put you in touch with qualified computer professionals, call John Corrigan, Vice-President/Classified Advertising, at 800/343-6474 in MA, 508/879-0700.

## COMPUTERWORLD

Where the qualified candidates look. Every week.

## COMPUTERWORLD

## MID-COAST MAINE

Bath Iron Works Corporation, one of the nation's leading shipbuilders for the U.S. Navy and Maine's largest private employer with over 5,000 employees, is seeking applicants for the following INFORMATION SYSTEMS positions. Our Information Systems Division, with over 200 professional and support personnel, is involved with:

**SYSTEMS INTEGRATOR (LAN/WAN).** Requirements include B.S. in Computer Science, 3 yrs. experience operating systems configuration and installation, 2 yrs. network management with LAN monitoring and troubleshooting skills. Novel Network Services, Inc., 6000 E. North Ave., Suite 100, Denver, CO 80231. Previous experience in design and implementation of LANs and integration of multiple systems in a distributed network environment. Position work closely with Network Architects, IS support personnel and end users with installation testing and delivery of systems technology. Ref #1

**NETWORK ARCHITECT.** Requirements include B.S. in Computer Science or comparable experience, extensive IBM Mainframe and data communications experience, and solid network diagnosis and troubleshooting skills. Experience required in VTAM, MCF Ver. 5, Netview and Netplex. The ideal candidate will have experience in IBM Mainframe and SNA/SDLC technology. Experience with integrating IBM systems in a corporate network environment is a plus, including knowledge of Novell Netware 3.x, Client Server technology, RS/6000 and AS/400 platforms. Responsibilities include evaluating, installing, integrating, and maintaining computer software products in an IBM MVS, UNIX, and Novell network environment. Ref 2

**CAD ANALYST II.** Position interacts closely w/Engineering CAD users and system programmers to optimize use of Computerized CAD/3D. Candidates must have manufacturing or engineering environment experience, extensive knowledge of Computerized CAD/3D, at least 1 yr "C" programming, 1+ yrs Oracle experience, and be familiar with a UNIX and distributed workstation environment, preferably SUN SPARC. BS in Engineering. Creativity, Science or comparable experience is preferred. Ref 3"

**ASSOCIATE PROGRAMMER.** This entry-level position requires strong "C" programming skills, CAD knowledge and desire to develop the skills to support a high tech user base in a distributed workstation environment. Candidates will have one or 1) "C" experience, UNIX environment familiarity, and at least one yr. hands-on experience with CV CADDS 4X software. BS in Engineering, Computer Science, or equivalent preferred. Ref #

### Programmer/ Programmer Analyst Positions

The following require a BS in Computer Science or Business, the ability to provide technical programming support to senior systems analysts and the customer, good communications and problem solving skills, and 1-2 yrs. programming experience.

**MTLS SYS DEV.** Focus is on re-engineering materials management proceess and supporting systems including development of system specifications, coding applications, unit testing, integration testing, and systems implementation. Positions require TSO or ROLCOE, COBOL, CICS, IMS, VSAM, JCL and PC/PC Network applications. Ref 5.

**INT MFG SYS.** Focus is integration of materials and work order processes including development of system specifications, coding applications, unit testing, integration testing, and system implementation. Position requires *MARJANA TORRES*, *CONRAD*, *CICS*, *VSAM*, and knowledge of *SOLC*. Ref 5

**INT MFG / SCHED SYS.** Focus is expansion of company's newly installed (8) of Materials/Work Order and integrated sched system's development. Responsibilities include support in developing system specifications, coding applications, unit testing, integration testing, and system implementation. These positions require DB2, MVS/ESA, TSO/ISPF, COBOL, CICS, VSAM, and knowledge of SDLC. Working knowledge of MACPAC/9 or Project 2

**PRODUCTION SUPPORT.** Focus is development of manufacturing management support systems and production applications including related development of system specifications, coding applications, unit testing, integration testing, and system implementation. Position requires COBOL, CICS, JCL, EASYTRIEVE, BASIC, Quattro, MVS, BRUNO and TSO. Production systems background is needed. Ref 6

Bath Iron Works offers an excellent compensation package including relocation assistance. Qualified candidates should send or fax resume with cover letter (including references) indicating Bath Iron Works membership to the below address or fax number.

**BATH IRON WORKS CORPORATION**

700 Washington Street MS 2090

Please include your location preference when responding; resumes shall be distributed to your location preference.

ScidFax your resume, indicating location preference to (617) 890-0774, Keane, Inc., Attn: Human Resources, Reservoir Place, 1601 Trapelo Road, Waltham, MA 02154. We are an equal opportunity employer. Keane opportunities are available nationwide.

**KEANE**

Systems & Computer Technology Corporation (SCT) is the nationally recognized leader in providing seminars, local government and higher education with application specific software and on-site computing management training. Over the past 3 years, SCT has grown by over 30% to \$320 million.

### DIRECTOR Utility Systems Implementation Team

This is an exceptional opportunity for an individual to build and manage SCT's Utility Systems Implementation Team. Your background should combine extensive utility experience with demonstrated facilities/project management skills. A working knowledge of computer/information technologies (ORACLE and UNIX preferred) and software project management tools is necessary. Effective communication skills and the ability to interact through all levels of management are prerequisites.

### UTILITY SYSTEM FUNCTIONAL CONSULTANTS

Several positions are immediately available for individuals who have 3+ years of utility system applications experience from a functional perspective. These positions are responsible for providing consulting expertise in the areas of utility system analysis/implementation and in the definition of policy, procedure and training requirements. These positions will entail 90-100% nationwide travel.

### UTILITY SYSTEM TECHNICAL CONSULTANTS (ORACLE Programmer/Analysts)

Several positions are immediately available for individuals to provide system installation/operations technical support to our clients. Candidates should have 2+ years ORACLE/UNIX experience. A knowledge of GUI and Forms 4.0 and experience in software installation/support would be significant assets. These positions will entail 90-100% nationwide travel.

### ORACLE DATA BASE ADMINISTRATOR

This is an excellent opportunity for an individual who has 4+ years of ORACLE 6.0 experience to assist our clients with the installation/OA of our Utility Systems. Candidates should have 2+ years UNIX experience. A knowledge of ORACLE 7.0 would be a plus. This position will entail 90-100% nationwide travel.

For more information, please forward your resume to: Corporate Recruiting Dept., SCT, Utility Systems & Computer Technology Corporation, 4 Country View Road, Malvern, PA 19355. Equal Opportunity Employer, M/F/H/V.

## JOIN A WINNING TEAM.

Keane, Inc., a \$350 million software developer, recognized by both *Fortune* and *Business Week* as one of the best companies in America, continues to recruit and grow. With over 3500 consultants nationwide we are one of the fastest growing companies of our type in the country. Our offices in Chicago, Los Angeles and Dallas have multiple opportunities for individuals with the following skill sets:

#### Chicago:

- SYBASE • ORACLE
- C • C++
- OBJECT ORIENTED
- EXPERT

Our Waterloo Corporate Center  
Suite 200, Winchester, IL

Positions Available Nationwide

## We've set a new goal for ourselves.

At Motorola Semiconductor Products Sector (SPS), excellence is simply not enough. We've already earned the enviable position of America's predominant semiconductor company by building the most diversified and advanced product line anywhere. But now, we've set our sights even higher. We're committed, completely, to a fully integrated Six Sigma approach that ensures quality engineering at its highest level.

Key to our leadership is our focus on next generation Information Systems technology. Working in a state-of-the-art environment, our people pursue the most advanced distributed computing solutions utilizing leading edge data modeling technology. When it comes to involvement and advancement, you won't find a more perfect setting. And when it comes to success, you won't find a more serious company. If you're along the same lines, consider the opportunities now available at our Phoenix, AZ and Austin, TX locations.

### Phoenix Openings

**Computer Integrated Manufacturing/Systems Engineers** — Perform distributed Manufacturing Applications, integration, development and support. Requires knowledge/skills in Oracle, CASE, SAS, UNIX and C programming.

**Data Analyst/Data Modeler** — Provide facilitating services to SPS Development Teams through all phases, analysis, design and implementation for defining, maintaining and mapping conceptual and system view of data into the sector data repository. Experience should include users data management responsibility. IEF CASE tool/cybercycle, Brownstone Repository and distributed systems IEF tool set knowledge a plus.

**EDW/IEF Analyst** — Design the interface to the new IEF/DB2 order processing system for EDI transactions, requiring effective project management, and QA techniques to design the Marketing related systems. Will interact with business clients, review business problems and identify solutions. Experience should emphasize systems analysis and business modeling. Comprehensive knowledge of IBM mainframe environment (MVS, IMS, DB2, TSO, DL1, etc.) essential, as is experience with IEF CASE tool.

**IEF Systems Engineers** — Utilize information engineering methodology techniques to create process and data models for current/future business requirements, plus design/develop interfaces to support transition from current to new systems environments. Experience should emphasize systems analysis, business modeling and systems development using IEF. Knowledge of IBM mainframe (MVS, IMS, DB2, TSO, DL1 and distributed systems) required; IEF tool set knowledge a plus.

**Systems Test Engineering Analyst** — Perform unit and integration test of the SPS Order Processing System. Experience required in Software Developmental Life Cycle process, testing phase, project installation background in large scale IMS, IEF, DB2 environments preferred.

### Austin Openings

**Strategic Marketer** — Work with PC chip sets, cache controllers and MPUs. Requires experience marketing to PC manufacturers.

**Computer Integrated Manufacturing Development Manager** — Lead a team responsible for CIM systems projects ranging from production equipment interfaces through factory level planning systems. Knowledge of C++, Oracle, SQL, and UNIX is essential.

**Software Customer and Product Support Engineer** — To support development of chip sets, firmware, graphic controllers, systems and software on a power PC running Microsoft Windows NT. Experience in device drivers, C++, compilers, firmware, HAL and tools is essential.

**Software Engineer** — Requires strong C programming skills and familiarity with X Windows programming, as well as knowledge of UNIX, C++ and CAD algorithms.

**Systems/Analysts** — Requires background in applications development, logical/physical design, coding and test. Experience with UNIX, RDBMS design (Oracle), IBM MVS and VM/QS essential.

Motorola offers competitive compensation and benefits. Interested candidates are invited to FAX their resumes to Bill Ross at (602) 994-6877. Or mail resume to his attention at: Motorola SPS Sourcing, Dept. SPS-6877, 1434 W. Broadway Rd., Suite B106, Tempe, AZ 85282. An Equal Opportunity/Affirmative Action Employer. We Welcome And Encourage Diversity In Our Workplace.

## Going Global

*GSC Intelcom is the leading developer of information systems for the telephony industry. We're seeking results-oriented professionals to participate in our continued success in providing information technology solutions worldwide.*

## EXTRACT — LONDON, SEPTEMBER 10, 1875.

We're seeking Technical Consultants to provide consulting support for billing and sales order processing information systems. Previous consulting experience in the telephony industry is required. Assignments are six months to two years in duration. Reference Code BW-ET-72

## NEWPORT BEACH, CA

Immediate needs exist for C, C++ and PRO/IV/4GL Programmer/Analysts, Systems Designers, and Subject Matter Experts. You'll be performing product enhancement and customization. Positions require two years related experience. Previous telephony information systems experience is highly preferred. Significant international travel may be required. Reference Code BW-NP.

## ROCHESTER, NY

Successful applicants will possess a related degree and at least five years professional software development experience (telephony industry experience preferred). Positions require design and development proficiency in either MS Windows Visual Basic with extensive GUI and data communications experience or C, C++/UNIX experience. **Reference Code JA-NY.**

## DENVER, CO

We're seeking pro-viders in the telecommunications software arena to manage large-scale product development efforts. Additionally, you'll be responsible for client management and new business development support. Positions require a minimum of 10 years experience in project management, excellent communications skills, and a thorough knowledge of software development methodologies. We have additional requirements for: Operations Consultants with telephone company workforce management systems experience; Software Engineers with database and functional specifications qualifications; Informatics Developers; Software Testers; and Customer Service Support Representatives. **Reference Code IA-DP.**

## TAMPA, FL

You'll be providing software test and validation on large telecommunication billing systems. Successful applicants will possess at least two years professional experience in CRSS billing software. **Reference Code BW-TF.**

## CHAMPAGNE, II

Leverage your Ingres or C/C++ skills to develop billing systems solutions for the expanding wireless communications industry. We continue to grow and have additional positions in COBOL Programming (IBM mainframe), Customer Service, and Quality Assurance. **Reference Code BS-04.**

## Washington, DC

We're looking for some top-notch Project Managers and Programmer/Analysts who possess experience in telecommunications billing systems. You should have at least four years COBOL and C/C++ programming experience in an IBM mainframe environment combined with additional professional experience in C and C++, Object Oriented programming, and Client Server architecture. **Reference Code BW-DC**

We will be providing LOCAL INTERVIEWS in most major cities for selected applicants. To ensure prompt consideration, please use the appropriate Reference Code for your response.

In return for your skills and commitment, we offer generous compensation and benefit packages. Relocation and foreign assignment differentials will be offered on an as needed basis. Please respond by sending a resume and salary history using the appropriate Reference Code to: CSC Intelligence, 6707 Democracy Blvd., Suite 1000, Bethesda, MD 20817, Attn: Staffing Manager, Ref. Code \_\_\_\_\_, or by FAX to (301) 521-6581. NO PHONE CALLS PLEASE. An Equal Opportunity Employer M/F/D/V.

**CSC INTELICOM**

*A Company of Computer Sciences Corporation*

## SOFTWARE PROFESSIONALS NEEDED

Information Management Resources, Inc. (IMR) is an international software development and consulting organization dedicated to helping businesses and industries maximize their information systems potential through innovative and creative software solutions. We are currently seeking Project Managers, Technical Specialists, Analysts, and Programmers with knowledge and experience in any of the following skills to work in the following locations: NJ, NY, MD, VA.

- DB2/IC/SQL • C82 PM • GUI design • MS-Windows (SDI) • 386/370/Assembler • AS/400/SYNNAP/3 • PL/I • Powerbuilder • ADWATEP • SAS DB/DC • C, C++ • JADPAD • A/PS/SPITELON • Oracle 7.0

**Oracle®/Pinnacle® • Sybase • UNIX/MS-DOS/Windows • Apple**  
 IBM offers excellent compression and a comprehensive benefits package. Interested candidates who are available immediately and willing to relocate within the United States should reply by E-mailing, meeting, or having a detailed resume in confidence submitted to the Personnel Department, IBM, 1000 Corporate Center Drive, Number 18: Staffing Manager, (Ext. 800-CW221), Information Management Resources, Inc. 26750 U.S. Highway 19 N Suite 250, Clearwater, FL 34615-0443. Fax: (813) 797-7000. E-Mail: [IBM@IMR.COM](mailto:IBM@IMR.COM) FAX: (813) 797-7000. E-Mail: [IBM@IMR.COM](mailto:IBM@IMR.COM)

## PROGRAMMER/ANALYSTS

**WE OFFER:**

- Full-time, salaried positions
- Extensive training programs
- An 11 year record of growth

**OPPORTUNITIES:**

- Client Server
- PowerBuilder, Visual Basic, Access
- SQL Server, Sybase, Oracle
- Mainframe

**CICS, IMS, DB2, TELON, COROL**

For immediate consideration contact:

**Robert Farrow, National Recruiting Manager, CH2M, 8133 Greenwood Way, Jacksonville, FL 32256**

**Joe JIMM, 722-4329**

**Computer Management Sciences, Inc.**

**WEST Technologies, Inc.**, a subsidiary of U S WEST, is an equal opportunity employer comprised of 5,000 employees who have responsibility for multimedia/entertainment services, financial software and system design, development, maintenance, enhancements and operations. One of the seven largest companies created by the 1984 breakup of the Bell telephone System, U S WEST (NYSE: USW) is in the communications business, helping customers share information, entertainment and communications services in local markets worldwide. The corporation is an organization recognized globally for its commitment to diversity.

## Software Project Management

**Work:** In client management to negotiate and develop project plans. Manage technology personnel to ensure effectiveness in plant and software development project success. You must be versed in modern design and development techniques, as well as many age-old methods. You will be responsible for planning, tracking, quality, risk, and cost management, organization, and communication with all project interactions. Requirements include: BS/MS in CS, MS, EE or equivalent; 3-5 years' project management experience of medium and large projects, technical development of software systems integration and new service development; UNIX, C, C++, distributed systems, excellent people/team skill; knowledge of software engineering and development processes, strong problem-solving and verbal/written communication and presentation skills. REF/RG/DP.

### Members of Technical Staff/Software Development

Participate in detailed software design and document in the design, use Object-Oriented methods; engineer programming solutions in C, C++, embedded SQL, UNIX script language and various UNIX tools, testing and debugging software; write engineering reports and proposals; and other project group tasks; perform impact analysis for proposed systems (HW and SW) changes. Requirements include: BS in Computer Science (MS preferred); software engineering experience using C or C++; soft skills: communication, team work, problem solving, and time management; engineering or course work using X-Windows and Motif with Hewlett-Packard, Sun, Apollo or Pyramid hardware; excellent verbal/written communication skills; and the ability to work effectively in a team environment. Desired experience includes: Object-oriented programming, software engineering, and database and system programming, and XVI, Informix, and Database.

### Members of Technical Staff/Corporate Data

We have a number of positions available in our Corporate Data and Transaction Management Organization. Requirements include: BA/BS Degree in MIS, CIS, Computer Science or Business; experience in Logical Data Modeling and Data-Based Administration; 3+ years' system/data development experience; and, Object-Oriented, distributed data and/or Client-Server technologies experience. Working knowledge as a change advocate/agent of shared, corporate data paradigms and experience in data content conversion is also required. REF/IGV.

U S WEST Technologies, Inc. is an equal opportunity employer. Any offer of employment is contingent upon the applicant's undergoing and passing a pre-employment drug test, subject to federal, state and local law. Interested candidates, please send resume, with cover letter, indicating REF#, to U S WEST Technologies, Inc., 4001 Discovery Dr., Suite 120, Boulder, CO 80303.

**Now you have a better way to recruit  
university and college students  
planning computer careers:**

## **Computerworld's seventh annual Campus Recruitment Edition**

**Issue Date: October 31, 1994**

**Close: September 16, 1994**

If you recruit top computer career students on America's campuses, your message in this special issue will target more of them than any other newspaper or magazine!

**Now you can recruit computer talent on campus without leaving your office!**

That's because 100,000 copies of this special issue will be distributed to America's best and brightest students enrolled in Information Systems (IS), Computer Science, Computer Engineering, Electrical Engineering, and just about any other computer-related curricula.

**Finally you can cost-effectively reach the quality and quantity of students you need!**

And you can do it with just one ad in *Computerworld's Campus Recruitment Edition!* For a

rate card reflecting complete campus distribution, call John Corrigan, Vice President/Classified Advertising, at 800/343-6474 (in MA, 508/879-0700). But hurry ... this issue closes September 16, 1994.

### **Planned Editorial Features:**

(subject to revision)

- Companies where computer career students want to work. And their top choices for: Information Systems, Engineering, Sales & Marketing, Technical Support, Research & Development.
- Information Systems salaries from Computerworld's annual survey with the Association for Systems Management
- And much more!

**"...New business generated by our weekly advertisements in Computerworld's Marketplace Pages more than pays for our advertising costs."**

*- David I. Rouso  
President  
Executive Infosource*

From its start as an exporter of IBM's 9370 line to European leasing companies, Executive Infosource has established itself as the world's leading 9370/9221 dealer. Headquartered in Buffalo Grove, Illinois, this five-year-old company now positions itself as a domestic dealer participating in export markets. Today, Executive Infosource offers a full range of System 370/390 solutions to customers in the United States, Europe, Asia, Latin America, and the Mideast. Believing that continuity and consistency in a widely read publication are key to its advertising success, President David Rouso advertises in *Computerworld's Marketplace Pages* every week.

"Because Executive Infosource is a niche product provider, we have a unique story to tell. All of our System 370/390 rack-mounted processors are excellently refurbished, completely equipped, and fully eligible for IBM maintenance. Equally important, however, is the technical expertise we provide to a large number of end users. From planning and expertly configuring systems per customer specifications to offering complete system engineering support, Executive Infosource does it all - and with the highest level of customer satisfaction. To increase our awareness among new sales prospects, we advertise in *Computerworld's Marketplace Pages*.

"Since *Computerworld* is widely read by decision-makers, *Computerworld's Marketplace Pages* give us wide reach to prominent buyers. Based on our results, it's the best publication for telling IS management about our 370/390 solutions for economical mainframe processing when application requirements are complex. It's also the best place for fostering partnerships with software developers so that we can offer clients better pricing and value-added system engineering support via a team approach.

"On average, our responses come from a broad spectrum of highly qualified prospects, and our end-user draw is significant. In fact, new business generated by our weekly advertisements in *Computerworld's Marketplace Pages* more than pays for our advertising costs. Another significant outcome is our changing market ratio. Once 90% foreign and 10% domestic, our business now runs about 50%/50%, so it's fair to say that our weekly advertising in *Computerworld's Marketplace Pages* has substantially increased our visibility in the U.S. marketplace. Amazingly enough, we've even finalized export deals with readers of *Computerworld's* U.S. edition.

"While there's a certain prestige associated with appearing in *Computerworld* week after week, proven results are our first and foremost reason for advertising in *Computerworld's Marketplace Pages*. Every week."

*Computerworld's Marketplace Pages*. It's where computer buyers meet computer sellers - every week. Just ask David Rouso of Executive Infosource. To put your classified sales message into the hands of 629,000 influential buyers, call John Corrigan, Vice President/Classified Advertising, at 800/343-6474 (in MA, 508/879-0700).

Great names

## Woody Woodard

Director of operations and  
technical services,  
The Home Depot, Inc., Atlanta

An

to

You've tried to figure out  
product introductions  
the scientific way.  
Here about figuring when  
readers might actually  
consume products based  
on the stars?  
Here it goes:

March 21 - April 20

Products born during  
this time inspire  
affairs and are  
common with appearance,  
large and outer  
personality. They enable  
users to adapt from  
scripts based on  
personal desires.  
Annoyances:  
Guts.

April 21 - May 20

Products born during  
this time enable the  
user to be measured,  
imagination and stable  
and is centered, yet  
created resources  
nature, progression  
and power job.  
Annoyances:  
Inevitable products  
and service.

May 21 - June 20

Products born during  
this time make  
concessions in their  
immediacy environment,  
learning and exchanging  
information to com-  
municate and learn  
from others.  
Annoyances:  
I can, please,  
network.

## Quotables

"Man is still  
the most  
extraordinary  
computer of all."

John F. Kennedy  
in a 1963 speech

Was Ross Perot's PRESIDENTIAL bid a SLIMMER OF THINGS TO COME? WHAT TEAM OF COMPUTER INDUSTRY PEOPLE DO YOU  
THINK SHOULD RUN FOR PRESIDENT AND VICE PRESIDENT, AND WHY? LET US KNOW WHAT YOU THINK (PREFERABLY ANONYMOUSLY).  
CONTACT LOIS BY AT (800) 343-6474 X234 OR COMPUTERS 7637.2323. IF WE USE YOUR IDEA, WE'LL SEND YOU A DUTY.  
(DON'T PLEASE LEAVE A CONTACT NUMBER.)

## Variations on

- ☒ Identical units tested under identical conditions will not be identical in the field.
- ☒ Interchangeable parts won't.
- ☒ If a circuit cannot fail, it will.
- ☒ A failure will not appear until a unit has passed final inspection.

## The 5th Wave by Rich Tennant

"MY GOD, YOU'VE DONE IT! MILLIONS OF MICROSCOPIC SLINKY  
TOYS MOVING ACROSS CIRCUITS AT THE SPEED OF LIGHT  
FORMING THE FIRST SLINKY OPERATING SYSTEM!"

## Inside Lines

### Cerebral celebration

As is its wont, Novell will use the BrainShare developers conference late next month to discuss all recently announced or forthcoming products. Among the agenda items, which should shortly see the light of day, is the Novell Embedded System Technology, an upcoming architecture for embedding NetWare services in a variety of devices that range from environmental monitors to fast-food cookers. Also on the list is NetWare Interconnect LAN Service with ATM capabilities and, of course, the sundry fixes and enhancements for the upcoming NetWare 4.1.

### Now hear this

Outsourcing's most hellbore pair, Electronic Data Systems and Computer Associates, went to a federal court hearing in Dallas last week to determine if certain data tapes are admissible evidence in their suits against each other, according to an EDS attorney. CA claims the tapes demonstrate software use and should be admitted as evidence that EDS is guilty of unauthorized use of CA software. EDS claims the tapes do not prove software use and wants to dispose of them. A ruling is expected this week.

### Familiar (cloudy) skies

As EDS looks to the heavens for outsourcing business, it must be feeling quite a sense of déjà vu. It wasn't long ago that the company agonized through more than a yearlong-on-again, off-again closing of its megadeal with Continental Airlines. Now Lufthansa German Airlines is talking at the dotted line after the two companies publicly declared their intentions to do business together. EDS had expected to close the deal by now [CW, Dec. 20, 1993], but Chief Financial Officer Judy Grant told analysts recently that he's uncertain of its completion. The sides are at odds over ownership of a joint venture involved with the potential \$2 billion deal. EDS is meeting with the board of the government-owned airline this week.

### Ties that bind ...

Solbourne Computer plans to announce a major program next week to recruit first-line client/server users by partnering with Oracle. Under the plan, Solbourne will provide SPARC-based symmetric multiprocessing servers, Oracle Financials and other applications and consulting help for getting the bundle installed and running smoothly. Solbourne tossed aside its history as a largely scientific and engineering firm about 18 months ago to remake itself as a source for hardware/software package deals, focused mainly on Oracle.

### Ties that don't

The Data Link Switching (DLS) Workgroup decided last week to change its status from a SIG (special interest group) within IBM's APPN Implementers Forum to a RG (related interest group), which is less subject to IBM control, a group spokeswoman said. The group also decided to begin the process of making DLS, the TCP/IP-based BNA routing protocol, an IETF standard by having a birds-of-a-feather session at the next IETF meeting in March.

### Warehouse managers wanted

Hewlett-Packard is beta-testing middleware for administering distributed data warehouses, a capability that analysts say is in short supply at present. HP says it expects Intelligent Warehouse software to be ready by late March.

IBM's delay in shipping symmetric multiprocessing versions of its PS/2 166 and 206 supercomputers, which were slated for last fall and then pushed to the first quarter, is hurting the company, many observers agree. Regardless, IBM continues to be vague about when the boxes will appear. "I don't know when you'll see the 166," said Michael Coleman, newly appointed general manager of the IBM PC Co. server division, last week. "I've been looking at all the product lines and seeing what needs emphasis and what doesn't." PEOPLE BACK AT HEADQUAR-  
TERS CAN REACT QUICKLY

To aggressively meet the challenges of competing in a 'Unified Europe,' General Motors Europe has streamlined, with the help of EDS, a Lotus Notes Business Partner. Central to this new structure is Lotus Notes, the vanguard of a new category of software called groupware.

## GENERAL MOTORS USES NOTES TO UNIFY EUROPE. HOW BIG IS YOUR PROBLEM?

GM Europe is as large and complex as some countries. With over 100,000 people plus 6,500 dealers, it operates across 18 languages and countless networks. With multinational divisions including Opel, Vauxhall and Saab, GM boasts two of the fastest growing car lines in Europe.

Lotus Notes® unique teamwork capabilities and rich data management facilities allow GM to carry out time-sensitive contractual and developmental work by teams dispersed across the continent. To share financials. To improve manufacturing standards. To upgrade dealer service. To track market trends. And finally, to accelerate key business processes.

According to Pat Hickey, GM Europe's OIS Information Manager, Notes is

the forum for exchanging information and ideas to make us more competitive. Choosing it is one of the most popular decisions we've ever made.\*

Today, operations are so efficient that the entire European continent is run from a central office of just 200 people and so effective that General Motors has grown from #5 in Europe to #2 over the last few years.

Now plans are underway to get approximately 40,000 Notes users on line in the US by 1996. Evidently, what's good for General Motors Europe, is good for America.
